1.2 Purpose of the document

34227

This document is only for device types "IO-Link master - EtherNet/IP gateway (DataLine) 4 port IP 65 / IP 66 / IP 67" (art. no.: AL1320).

It is part of the device and contains information about the correct handling of the product.

- Read this document before using the device.
- Keep this document during the service life of the device.

1.3 Explanation of Symbols

34171

WARNING

Warning of serious personal injury.

Death or serious irreversible injuries may result.

CAUTION

Warning of personaly injury.
Slight reversible injuries may result.

NOTICE

Warning of damage to property

Important note
Non-compliance can result in malfunction or interference

2 Safety instructions

Content

General	7
Required background knowledge	7
Safety symbols on the device	7
IT security	8

28333

2.1 General

58525

- The device described is a subcomponent for integration into a system. The manufacturer is responsible for the safety of the system. The system manufacturer undertakes to perform a risk assessment and to create documentation in accordance with legal and normative requirements to be provided to the operator and user of the system. This documentation must contain all necessary information and safety instructions for the operator, the user and, if applicable, for any service personnel authorised by the manufacturer of the system.
- Read this document before setting up the product and keep it during the entire service life.
- The product must be suitable for the corresponding applications and environmental conditions without any restrictions.
- Only use the product for its intended purpose (→ **Intended use** (→ p. 9)).
- If the operating instructions or the technical data are not adhered to, personal injury and/or damage to property may occur.
- The manufacturer assumes no liability or warranty for any consequences caused by tampering with the product or incorrect use by the operator.
- Installation, electrical connection, set-up, programming, configuration, operation and maintenance of the product must be carried out by personnel qualified and authorised for the respective activity.
- Protect units and cables against damage.

2.2 Required background knowledge

34185

This document is intended for specialists. Specialists are people who, based on their relevant training and experience, are capable of identifying risks and avoiding potential hazards that may be caused during operation or maintenance of the product.

The document contains information about the correct handling of the product.

2.3 Safety symbols on the device

34199

General warning

Observe instructions in chapter "Electrical connection" (→ **Electrical connection** (→ p. 14))!

2.4 IT security

54678

NOTICE!

If the device is operated in an unprotected network environment.

- > Unauthorised read or write access to data is possible.
 - > Unauthorised manipulation of the device function is possible.
 - Check and restrict access options to the device:
 - Restrict access to authorised persons.
 - Do not connect the device to open networks or the internet.
- If access from the internet is inevitable:
- choose a safe method to connect with the device (e. g. VPN).
 - Use encrypted data transmission (e. g. https / TLS).

3 Intended use

58283

The device may only be used for the following purposes:

- as IO-Link master for configuration, administration and operation of IO-Link devices
- as gateway between IO-Link devices and AS-i network

The device is designed for use without a control cabinet in plant construction.

- Only use the device within the limits of the technical data (→ **Technical data** (→ P. [95](#))).

33860

4.1.1 IO-Link

34084

The device offers the following IO-Link functions:

- IO-Link master (IO-Link revision 1.0 and 1.1)
- 4 IO-Link ports for connection of IO-Link devices
- Provision of process data of the connected IO-Link devices for LR SMARTOB SERVER monitoring software (→ www.ifm.com)

4.1.2 EtherNet/IP

52585

The device offers the following EtherNet/IP functions:

- EtherNet/IP Device
- 2 port switch for access to the EtherNet/IP interface
- Gateway for transmission of the process and parameter data between the connected IO-Link devices and the higher-level EtherNet/IP controller
- Min. cycle time: 1 ms (RPI)
- Connection classes: 1, 3
- Connection Application types: Exclusive Owner, Input Only, Listen Only Connections
- UCMM supported
- Predefined standard objects:
 - Identity Object (0x01)
 - Message Router Object (0x02)
 - Assembly Object (0x04)
 - Connection Manager (0x06)
 - DLR Object (0x47)
 - QoS Object (0x48)
 - TCP/IP Interface Object (0xF5)
 - Ethernet Link Object (0xF6)
- Supported protocols: DHCP, BOOTP, ACD, DLR
- Device description: EDS file

4.1.3 Internet of Things (IoT)

54679

The device offers the following IoT functions:

- Gateway for the transmission of process, parameter and monitoring data between IO-Linkmaster / IO-Link devices and the IT network level
- REST-API to access process and parameter data
- Supported protocols: TCP/IP JSON, MQTT

4.1.4 Security mode

54697

The IoT interface offers the following optional security functions:

- Secure data transfer via encrypted connection (Secure Layer Transport - TLS)
- Access protection via authentication

4.1.5 Parameter setting

34210

The device provides the following configuration options:

- Parameter setting of the IO-Link master of the AL1320 with LR DEVICE parameter setting software, EtherNet/IP projection software or ifm IoT-Core services.
- Parameter setting of the connected IO-Link devices (sensors, actuators) with LR DEVICE parameter setting software, EtherNet/IP projection software or ifm IoT-Core services
- Storage of parameter sets of the connected IO-Link devices for automatic recovery (data storage)

4.1.6 Visual indication

34192

The device has the following visual indicators:

- Status and error indication of the gateway, of the EtherNet/IP connection and of the system
- Status display of the voltage supply
- Status and activity display of the Ethernet connection
- Status, error and short circuit/overload indication of the IO-Link ports

4.2 Digital inputs

33817

The device has 4 additional digital inputs (type 2 according to EN 61131-2).

The digital inputs are on pin 2 of the ports X01...X04.

All inputs refer to the potential of the device supply (pin 3).

4.3 IO-Link supply

34077

The device has 4 supplies for IO-Link devices.

The IO-Link ports X01...X04 are ports class A.

Every supply provides short circuit monitoring.

The device ensures fire protection for the connected IO-Link devices by providing a power-restricted circuit at the IO-Link ports (according to IEC61010-1 and Class 2 according to UL1310).

5 Mounting

Content

Mount the device	13
	34058

5.1 Mount the device

34059

- ▶ Disconnect the system from power before installation.
 - ▶ For installation choose a flat mounting surface.
 - ▶ Please observe the maximum tightening torque.
-
- ▶ Fix the unit to the mounting surface using 2 M5 mounting screws and washers.
 - Tightening torque: 1.8 Nm
 - ▶ Ground the unit via the two mounting screws of the upper mounting lugs.

6 Electrical connection

Content

Notes	14
Connecting the EtherNet/IP ports.....	15
Connecting the IoT port	15
IO-Link ports	16
Connecting the device	18

33805

6.1 Notes

51957

A qualified electrician must connect the unit.

- ▶ The national and international regulations setting up electrical equipment must be complied with.

The unit is only suitable for operation using SELV/PELV voltages.

- ▶ Please note the information concerning IO-Link wiring!

This unit contains components that may be damaged or destroyed by electrostatic discharge (ESD).

- ▶ Please observe the required precautions against electrostatic discharge!

The M12 connection parts in the device comply with the ingress resistance requirements of the standard EN 61076-2-101. To adhere to the protection rating, only cables certified to this standard must be used. The system creators undertake to ensure ingress resistance for cables which they cut to length themselves.

- ▶ Carry out the fitting according to the indications of the cable manufacturer. A maximum of 0.8 Nm is permitted.
- ▶ During installation, place the M12 connector vertically so that the coupling nut will not damage the thread.
- ▶ Depending on the mounting conditions, cables must be provided with a strain relief to avoid unacceptable loads on the mounting points and M12 connections.
- ▶ Make sure that the M12 connection parts are correctly seated and mounted correctly. The specified protection rating can not be guaranteed if this is not observed.

For UL applications:

- ▶ To connect the IO-Link master and the IO-Link devices, only use UL-certified cables of the CYJV or PVVA category with a minimum temperature of 80 °C (75 °C in case of maximum ambient temperature of 40 °C).

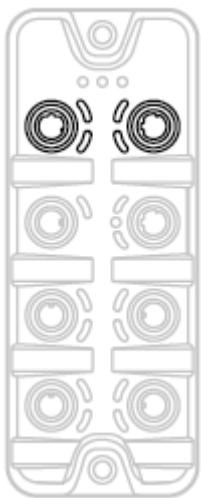

Wiring: → **Technical data** (→ p. [95](#))

By means of basic insulation according to EN61010-1, the circuits are separated from each other and from device surfaces that could be touched (secondary circuit with 30 V DC maximum, supplied from mains circuit up to 300 V overvoltage category II).

By means of basic insulation according to EN61010-1, the communication interfaces are separated from each other and from device surfaces that could be touched (secondary circuit with 30 V DC maximum, supplied from mains circuit up to 300 V overvoltage category II). They are designed for network environment 0 according to IEC TR62102.

6.2 Connecting the EtherNet/IP ports

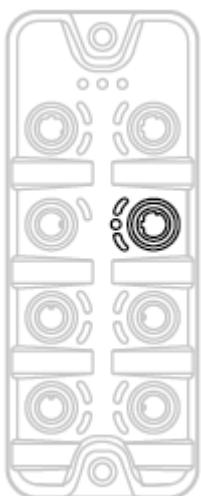

33671

- ▶ Connect the device via the M12 socket X21 and/or X22 to the EtherNet/IP network
(e.g. EtherNet/IP PLC, additional EtherNet/IP device)
- ▶ To connect the devices, use M12 connectors with protection rating IP 65 / IP 66 / IP 67 or higher (→ **Accessories** (→ p. 93)).
- ▶ Cover the unused sockets with M12 protective caps (art no. E73004).

6.3 Connecting the IoT port

34044

- ▶ Connect the device via the M12 socket X23 to the IT network (e.g. laptop/PC with LR DEVICE parameter setting software, laptop/PC with LR SMARTOB SERVER monitoring software, laptop/PC with software capable of processing http requests).
- ▶ To connect the devices, use M12 connectors with protection rating IP 65 / IP 66 / IP 67 or higher (→ **Accessories** (→ p. 93)).
- ▶ Cover the unused sockets with M12 protective caps (art no. E73004)

6.4 IO-Link ports

The IO-Link ports of the AL1320 meet the requirements of the IO-Link specifications 1.0 to 1.1.2.

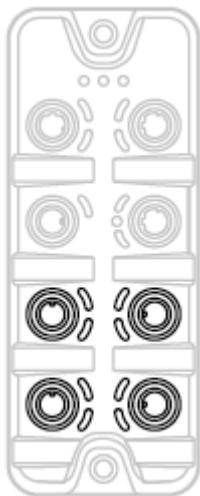

- ▶ Please note the information concerning IO-Link wiring!
- ▶ Cover unused sockets with M12 protective caps (art. no.: E73004).

6.4.1 Connecting IO-Link devices for Class A operation

Wiring information:

- The connected IO-Link devices must be supplied exclusively via the IO-Link master.
- The additional digital inputs IO-Link ports X01...X04 (pin 2) have a type 2 behaviour according to the standard EN61131-2. The connected electronics must be electrically suited for this.

- ▶ Connect the connectors of the IO-Link devices with the M12 sockets of the IO-Link ports X01...X04.
 - Maximum cable length per IO-Link port: 20 m
- ▶ To connect the devices, use M12 connectors with protection rating IP 65 / IP 66 / IP 67 or higher (→ **Accessories** (→ p. [93](#))).

6.4.2 Connecting IO-Link devices for Class B operation

Notes on wiring:

- For Class B operation, the IO-Link device must be supplied with an additional auxiliary voltage UA using a Y connection cable.

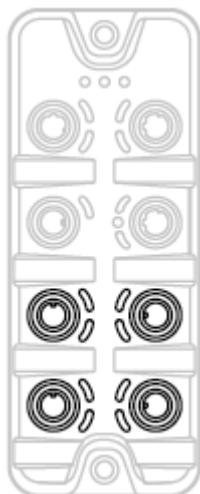

WARNING

Non-compliance with the electrical separation of the circuits

- > Risk of fire!
- ▶ Ensure that the external supply UA is galvanically separated from the circuit of the IO-Link Master by assuring basic insulation (according to IEC 61010-1, secondary circuit with 30 V DC maximum, supplied from mains circuit up to 300 V of overvoltage category II).
- ▶ Ensure that the IO-Link devices and the connection technology support the galvanic separation.

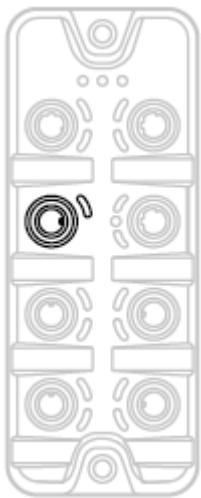

In case of operation as port class B, the additional digital input of the IO-Link port (pin 2) is not available!

- ▶ Connect the connectors of the IO-Link devices via a Y connection cable with the M12 sockets of the IO-Link ports X01...X04.
- ▶ Connect the Y cable to 24 V DC (20...30 V SELV/PELV)
- ▶ To connect the devices, use M12 connectors with protection rating IP 65 / IP 66 / IP 67 or higher (→ **Accessories** (→ p. [93](#))!).

6.5 Connecting the device

33882

- ▶ Disconnect power.
- ▶ Connect the IO-Link Master via M12 socket X31 to 24 V DC (20...30 V SELV/PELV; according to EN61010-1, secondary circuit with maximum 30 V DC supplied by mains circuit up to 300 V of overvoltage category II).
 - Maximum cable length: 25 m
- ▶ To connect the device, use M12 connectors with protection rating IP 65 / IP 66 / IP 67 or higher (→ **Accessories** (→ p. [93](#))).

When using cable length greater than 25 m keep in mind the voltage drop as well as the required minimum voltage supply of 20 V!

7 Operating and display elements

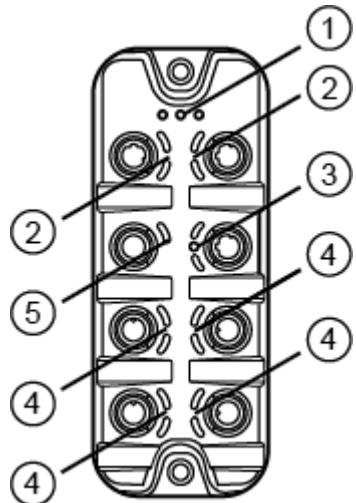

Content

Overview.....	19
LED indicators	20

34063

7.1 Overview

34356

- (1) RDY, NET and MOD status LEDs
→ **Status LEDs** (→ p. [20](#))
- (2) LNK and ACT status LEDs of the EtherNet/IP interfaces 1 (X21) and 2 (X22)
→ **Ethernet ports** (→ p. [20](#))
- (3) LNK, ACT status-LEDs and IoT LED of the IoT interface (X23)
→ **IoT port** (→ p. [21](#))
- (4) IOL and DI status-LEDs of the IO-Link port (X01...X04)
→ **IO-Link Ports (Class A)** (→ p. [21](#))
- (5) PWR status LED of the voltage supply (X31)
→ **Voltage supply** (→ p. [21](#))

34047

7.2 LED indicators

The device only has the following LED indicators:

7.2.1 Status LEDs

34408

The RDY LED indicates the status of the gateway.

The NET LED (Network Status) indicates the status of the network.

The MOD LED (Module Status) indicates the status of the EtherNet/IP module.

Status LED			Description
RDY	green	on	Status: OK
		flashes 5 Hz	Status: Error
		flashes (200 ms on, 800 ms off)	Status: Firmware update is running
		off	Status: Gateway not running or gateway booting
NET	green / red	off	Not powered or powered, but IP address not yet configured
		flashes	Device self-testing
	green	flashes	No connection: no CIP connection established and a Exclusive Owner connection has not timed out
		on	Connection: at least one CIP connection established and an Exclusive Owner connection has not timed out
	red	flashes	Connection timeout: an Exclusive Owner connection has timed out
		on	Duplicate IP address: IP address already in use
MOD	green / red	off	No voltage or voltage too low
		flashes	Device self-testing
	green	flashes	Standby: device not yet configured (no IP address)
		on	Operational
	red	flashes	Major recoverable fault (e.g. incorrect configuration)
		on	Major unrecoverable fault (e.g. module failed)

7.2.2 Ethernet ports

34348

Each Ethernet port has 2 LEDs (LNK and ACT). The LEDs indicate the status of the Ethernet connection.

Status LED			Description
LNK	green	on	Ethernet connection established
		off	No Ethernet connection
ACT	yellow	flashes	Data is transmitted via the Ethernet interface.
		off	No data transmission

7.2.3 IoT port

The IoT port has the 3 LNK, ACT and IoT LEDs. The LEDs indicate the status of the Ethernet connection and the device identification.

Status LED			Description
LNK	green	on	Ethernet connection established
		off	No Ethernet connection
ACT	yellow	flashes	Data is transmitted via the Ethernet interface.
		off	No data transmission
IoT	green	flashes	Device identification active

7.2.4 Voltage supply

The interface for voltage supply (X31) has the LED that is marked as US. The LED indicates the status of the voltage supply.

Status LED			Description
US	green	on	The supply voltage Us is applied.
		off	No supply voltage is applied or the applied supply voltage is too low.

7.2.5 IO-Link Ports (Class A)

Each IO-Link Port Class A has 2 LEDs labelled IOL and DI. The LEDs indicate the status of the IO-Link port.

Status LED			Description
IOL	yellow	Off	Port configured as DI/DO: pin 4 (C/Q) = OFF
		on	Port configured as DI/DO: pin 4 (C/Q) =ON
	green	flashing 1 Hz	Port configured as IO-Link: no IO-Link device found
		Flashing with 2 Hz	Port configured as IO-Link: Status PREOPERATE
		on	Port configured as IO-Link: Status OPERATE
		Flashing with 2 Hz	Port configuration error or short circuit / overload on US
		on	Transmission Error
	red	Off	Digital input: pin 2 = OFF
		on	Digital input: pin 2 = ON
DI	yellow	Off	Digital input: pin 2 = OFF
		on	Digital input: pin 2 = ON

8 Set-up

When the supply voltage is switched on, the AL1320 starts with the factory settings. The display elements signal the current operating mode (→ **Operating and display elements** (→ p. [19](#))).

To enable parameter setting of the AL1320, the IoT interface and / or the fieldbus interface must be configured according to the network environment.

- ▶ Configure IoT interface (LR DEVICE: → **IoT: Configure IP settings** (→ p. [25](#)) or → **IoT: Configuring IP settings** (→ p. [47](#))).
- ▶ Configure fieldbus interface (LR DEVICE: → **Fieldbus: Configure IP settings** (→ p. [29](#)) or IoT: → **Feldbus-Schnittstelle konfigurieren**).
- > IoT / fieldbus interface has valid IP settings.
- > User can set the parameters of the AL1320.

Further steps:

- Optional: Update firmware of AL1320 (→ **Updating the firmware** (→ p. [91](#))).
- Set the parameters of the AL1320 (→ **Configuration** (→ p. [23](#))).

Configure IO-Link devices	36

33692

On delivery, the AL1320 is configured with the factory settings (→ **Factory settings** (→ p. [92](#))).

Required software: LR DEVICE (1.5.0.x or higher) (art.-no.: QA0011/QA0012)

9.1.1 Remarks

Content

Offline parameter setting	25
VPN connection	25

34180

Offline parameter setting

34060

The AL1320 supports the offline parameter setting. In this context, the user creates and stores a configuration for the IO-Link master and the connected IO-Link devices without being connected to the AL1320 (OFFLINE mode). The configuration created in this way can be stored as a file (*.lrp) and loaded to the AL1320 and activated at a later date.

Further information about offline parameter setting: → Operating instructions LR DEVICE

VPN connection

34382

An active VPN connection blocks the access of the parameter setting software LR DEVICE to the EtherNet/IP interface of the AL1320.

- ▶ Deactivate the VPN connection in order to be able to access the AL1320 with the LR DEVICE.

9.1.2 IoT: Configure IP settings

34049

For access to the IO-Link master via the IT infrastructure the user has to set the IP settings of the IoT port.

To configure the IP settings with DHCP, a DHCP server has to be active in the IT network. If no DHCP server can be reached in the IT network, an IP address is automatically assigned to the IoT port with the Zeroconfig protocol (address range: → **Factory settings** (→ p. [92](#))).

To configure the IP settings of the IoT interface:

- ▶ Select [IoT] menu.
- > The menu page shows the current settings.
- ▶ Set the following parameters as required:

Name	Description	Possible values	
[DHCP]	Activate/deactivate the DHCP client of the device	[Static IP]	IP settings were set by the user
		[DHCP]	IP settings are set by a DHCP server in the network.
[IP address]*	IP address of the IoT port	Factory setting: 169.254.X.X	
[Subnet mask]*	Subnet mask of the Ethernet network	Factory setting: 255.255.0.0	
[Default gateway IP address]*	IP address of the network gateway	Factory setting: 0.0.0.0	
[MAC address]	MAC address of the IoT port	The value is firmly set.	

* ... can only be edited if parameter [DHCP] = [Static IP]

- Save changed values on the device.

9.1.3 IoT: Configure security mode

54680

The IoT interface of the IO-Link offers a security mode. It enables secure data transmission via transport encryption and restriction of the access to IO-Link masters and IO-Link devices via user authentication.

To configure the security mode:

- Select [IoT] menu.
- > The menu page shows the current settings.
- Set the following parameters as required:

Name	Description	Possible values	
[Security mode HTTPS]	Set the security mode	[Disabled]	Security mode disabled
		[Enabled]	Security mode enabled
[Security password]	Password Note: The set password is not displayed.		

- Save changed values on the device.

The security mode only protects the access to the device via the IoT interface.
The user name "administrator" cannot be changed.

The security mode can be enabled without setting the password. During the attempt to write to the device, LR DEVICE requires to enter and confirm the password.

After entering the password, the user has unrestricted access to IO-Link masters and connected IO-Link devices. The password will only be requested again if the current LR DEVICE session is over (e. g. after restarting the LR DEVICE).

To change the set password:

- Sign in with a valid password.
- Enter the new password in the field [Security password].
- Write changes to the device.
- > The new password is set.

9.1.4 IoT: Configuring access rights

The access rights define which instance may read and / or write the parameter data, process data and event/diagnostic messages.

In order to configure the access rights to the IO-Link master:

- ▶ Select [IoT] menu.
- > The menu page shows the current settings.
- ▶ Set the following parameters as required:

Name	Description	Possible values	
[Access Rights]	The access rights to the parameter data, process data and the event/diagnostic messages of the IO-Link master as well as the connected IO-Link devices	[EtherNet/IP + IoT]*	<ul style="list-style-type: none"> ▪ EtherNet/IP and IoT Core have read and write access rights to parameters and process data ▪ EtherNet/IP and IoT Core have read access rights to events/alarms
		[EtherNet/IP + IoT (read-only)]	<ul style="list-style-type: none"> ▪ EtherNet/IP has read and write access rights to parameters and process data ▪ EtherNet/IP has read access rights to events/alarms ▪ IoT Core only has read access rights to parameters, process data and events/alarms
		[IoT only]	<ul style="list-style-type: none"> ▪ IoT Core has read and write access rights to parameters and process data ▪ IoT has read access rights to events/alarms ▪ EtherNet/IP has no access rights

* ... Factory setting

- ▶ Save changed values on the device.

If in LR DEVICE and EtherNet/IP projection software the parameter [Access Rights] is = [EtherNet/IP + IoT], the parameter values set in the EtherNet/IP projection software will always apply.

If the parameter [Access Rights] in LR DEVICE is = [IoT only], set the parameter [Access Rights] = [Keep settings] in the EtherNet/IP projection software.

If the parameter [Access Rights] in LR DEVICE is = [<Fieldbus> + IoT (read-only)], write access to the device configuration via LR DEVICE and IoT core services is blocked. To enable write access again, set the parameter to [<Fieldbus> + IoT] via fieldbus configuration software.

Changes of the parameter [Access Rights] will only be effective after restarting the IO-Link master (→ **Firmware: Reboot the device** (→ p. [35](#))).

9.1.5 IoT: Configure the interface to LR AGENT or LR SMARTOB SERVER

To enable transfer of process data from the IO-Link master to LR AGENT or LR SMARTOB SERVER, the interface has to be configured accordingly.

- ▶ Select [IoT] menu.
- > The menu page shows the current settings.
- ▶ Set the following parameters as required:

Name	Description	Possible values	
[IP address LR Agent or SMARTOB SERVER]	IP address of LR AGENT or LR SMARTOB SERVER	Factory setting: 255.255.255.255	
[Port LR Agent or SMARTOB SERVER]	Port number that is used to send process data to LR AGENT or LR SMARTOB SERVER	0 ... 65535	Factory setting:: 35100
[Interval LR Agent or SMARTOB SERVER]	Cycle time for the transfer of the process data to LR AGENT or LR SMARTOB SERVER (value in milliseconds)	[Off] 500 ... 2147483647	no transfer 500 ms ... 2147483647 ms
[Application Tag]	Source identifier of the IO-Link master in the structure of LR AGENT or LR SMARTOB SERVER (String32)	Factory setting: AL1320	

 After changing the parameter [Port LR Agent or SMARTOB SERVER] or [Application Tag], it may take 120 seconds before the device establishes a new TCP connection.

To prevent the delay:

- ▶ Reboot the device after changing the the parameter.

- ▶ Save changed values on the device.

9.1.6 Fieldbus: Configure IP settings

For communication with the EtherNet/IP network, the EtherNet/IP interface must be configured.

- Select [Fieldbus] menu.
- > The menu page shows the current settings.
- Set the following parameters as required:

Name	Description	Possible values	
[DHCP]	Enable / disable the DHCP client of the device	[Static IP]	IP parameters are set by the user
		[DHCP]	IP parameters are set by a DHCP server in the network.
		[BOOTP]	IP parameters are set via the Bootstrap Protocol (BOOTP)
[IP address]*	IP address of the EtherNet/IP port	Factory setting: 192.168.1.250	
[Subnet mask]*	Subnet mask of the IP network	Factory setting: 255.255.255.0	
[Default gateway IP address]*	IP address of the gateway	Factory setting: 0.0.0.0	
[Host name]	Name of the device in the EtherNet/IP network	e.g. ai1xxx	
[MAC address]	MAC address of the device	The value is firmly set.	
[Fieldbus firmware]		e.g. 3.4.04 (EtherNet/IP Adapter)	

* ... Parameter can only be edited if parameter [DHCP] = [Static IP]

- Save changed values on the device.

9.1.7 Fieldbus: set the configuration mode

The AL1320 supports the EtherNet/IP configuration modes "top-down" and "independent". Additionally, the user can configure the length of the transmitted process data and select the required connection types.

- ▶ Select [Fieldbus] menu.
- > The menu page shows the current settings.
- ▶ Set the following parameters as required:

Name	Description	Possible values	
[Configuration]*	EtherNet/IP configuration mode	Independent mode off	Configuration via fieldbus PLC
		Independent mode on	Configuration via AL1320
[Process data length]*	Length of process data per IO-Link port	2 bytes input 2 bytes output	2 bytes input data, 2 bytes output data
		4 bytes input 4 bytes output	4 bytes input data, 4 bytes output data
		8 bytes input 8 bytes output	8 bytes input data, 8 bytes output data
		16 bytes input 16 bytes output	16 bytes input data, 16 bytes output data
		32 bytes input 32 bytes output	32 bytes input data, 32 bytes output data
[Swap]*	Sequence of bytes in the data word	off	as Array of Bytes
		on	as Integer16 value; during an update of the process data, the bytes are exchanged
[Explicitpdmode]**	Enable / disable explicit PD mode and select the process data to be transmitted (connection types)	Explicit process data mode off	Explicit PD mode disabled
		Explicit process data mode with IO-Link I/O + Acyclic + Diag	Explicit PD mode enabled: IO-Link inputs /outputs, acyclic data and diagnostic data are transmitted
		Explicit process data mode with IO-Link I/O + Acyclic	Explicit PD mode enabled: IO-Link inputs/outputs and acyclic data are transmitted
		Explicit process data mode with IO-Link I/O	Explicit PD mode enabled: IO-Link inputs/outputs are transmitted

* ... Parameter can only be changed if the EtherNet/IP controller is disconnected

** ... Parameter only valid if [Configuration] = [Independent mode on]

- ▶ Save changed values on the device.

9.1.8 IO-Link ports: Activate data transfer to LR AGENT or LR SMARTOB SERVER

The user can decide separately for each IO-Link port whether the process data of the connected IO-Link devices should be transferred to LR AGENT or LR SMARTOB SERVER.

 To transfer process data the interface to the LR AGENT or LR SMARTOB SERVER has to be correctly configured (→ **IoT: Configure the interface to LR AGENT or LR SMARTOB SERVER** (→ p. [28](#))).

To activate / deactivate data transfer:

- ▶ Select [Port x] menu (x = 1...4).
- > The menu page shows the current settings.
- ▶ Set the following parameters as required:

Name	Description	Possible values	
[Transmission to LR Agent or SMARTOB SERVER]	Transfer of process data of the connected IO-Link device to LR AGENT oder LR SMARTOB SERVER	[Disabled]	Transfer process data
		[Enabled]	Don't transfer process data

- ▶ Save changed values on the device.

9.1.9 IO-Link ports: Configure operating mode

The IO-Link ports X01...X04 of the device support the following operating modes:

- Disabled: no data transfer at pin 4 (C/Q) of the IO-Link port
- Digital input (DI): binary input signal at pin 4 (C/Q) of the IO-Link port
- Digital output (DO): binary output signal at pin 4 (C/Q) of the IO-Link port
- IO-Link: IO-Link data transfer via pin 4 (C/Q) of the IO-Link port

The user can set the operating mode separately for each IO-Link port.

To set the operating mode of an IO-Link port:

- ▶ Select [Port x] menu (x = 1...4).
- > The menu page shows the current settings.
- ▶ Set the following parameters as required:

Name	Description	Possible values	
[Mode Pin4 US]	Operating mode of pin 4 of the IO-Link port	[Disabled]	Port deactivated
		[DI]	Operation as digital input
		[DO]	Operation as digital output
		[IO-Link]	Operation as IO-Link interface
[Cycle time actual]**	Current cycle time of the data transfer between IO-Link master and IO-Link device on the port (value in microseconds)	Parameter can only be read	
[Cycle time preset]*	Cycle time of the data transfer between the IO-Link master and the IO-Link device at the port (value in microseconds)	0	The device automatically sets the fastest possible cycle time.
		1 ... 132800	1 microsecond ... 132800 microseconds
[Bitrate]**	Current transmission rate of the data transfer between the IO-Link master and the IO-Link device on the port	Parameter can only be read	

* ... Parameter only available if [Mode] = [IO-Link]

** ... Parameter only visible if the IO-Link device is connected to the IO-Link port.

- ▶ Save changed values on the device.

9.1.10 IO-Link ports: Set the device validation and data storage

The user can choose how the IO-Link ports are to behave with regard to the device validation and the storage / recovery of parameter data of the connected IO-Link device.

The following options are available:

Option	Validation of the IO-Link device	Storage of the parameter values	Recovery of the parameter values
[No check and clear]	no	no	no
[Type compatible V1.0 device]	yes, test the compatibility with IO-Link standard V1.0	no	no
[Type compatible V1.1 device]	yes, test the compatibility with IO-Link standard V1.1	no	no
[Type compatible V1.1 device with Backup + Restore]	yes, test the compatibility with IO-Link standard V1.1 and identity of design (vendor ID and device ID)	yes, automatic storage of the parameter values; changes of the current parameter values will be stored	yes, recovery of the parameter values when connecting an identical IO-Link device with factory settings
[Type compatible V1.1 device with Restore]	yes, test the compatibility with IO-Link standard V1.1 and identity of design (vendor ID and device ID)	no, there is no automatic storage changes of the current parameter values will not be stored	yes, recovery of the parameter values when connecting an identical IO-Link device with factory settings

The options only apply if the IO-Link port is in the operating mode "IO-Link".

For options [Type compatible V1.1 device with Backup + Restore] and [Type compatible V1.1 device with Restore]: If the vendor ID and device ID are changed in the online mode, the data memory will be deleted and a new backup of the parameter values of the connected IO-Link device will be created in the IO-Link master.

To configure the device validation and the data storage:

- ▶ select [Port x] menu (x = 1...4).
- > The menu page shows the current settings.
- ▶ Set the following parameters as required:

Name	Description	Possible values	
[Validation / Data Storage]	Supported IO-Link standard and behaviour of the IO-Link master when connecting a new IO-Link device at port x (x = 1...4)	[No check and clear]	
		[Type compatible V1.0 device]	
		[Type compatible V1.1 device]	
		[Type compatible V1.1 device with Backup + Restore]	
		[Type compatible V1.1 device with Restore]	
[Vendor ID]	ID of the manufacturer that is to be validated	0...65535	Factory setting: 0# ifm electronic: 310
[Device ID]	ID of the IO-Link device that is to be validated	0...16777215	Factory setting: 0

- ▶ Save changed values on the device.

9.1.11 IO-Link ports: Setting fail-safe values

For the configuration mode "Independent" the user can set fail-safe values for the outputs of IO-Link ports. The fail-safe values will be activated in case of an interruption of the EtherNet/IP connection.

To set the fail-safe values:

- ▶ Select [Port x] menu (x = 1...4).
- > The menu page shows the current settings.
- ▶ Set the following parameters as required:

Name	Description	Possible values	
[Fail-safe digital out]*	Fail-safe value of the output for operating mode "Digital Output (DO)"	[Reset]	OFF
		[Old]	old value
		[Set]	ON
[Fail-safe IO-Link]*	Fail-safe value of the output for operating mode "IO-Link"	[Off]	no Fail-safe
		[Reset]	Fail-safe: OFF
		[Old]	Fail-safe: old value
		[Pattern]	Fail-safe: byte pattern

* ... Parameter only changeable, if the connection to the EtherNet/IP controller is closed

- ▶ Save changed values on the device.

9.1.12 Info: Show device information

To read the general information of the ifm IO-Link master:

- ▶ Select [Info] menu.
- > The menu page shows the current settings.

Name	Description	Possible values
[Product code]	Article number of the IO-Link master	AL1320
[Device family]	Device family of the IO-Link master	IO-Link master
[Vendor]	Vendor	ifm electronic gmbh
[SW-Revision]	Firmware of the IO-Link master	
[HW revision]	Hardware version of the IO-Link master	
[Bootloader revision]	Bootloader version of the IO-Link master	
[Serial number]	Serial number	

9.1.13 Firmware: Reset device to factory settings

33838

When the IO-Link master is reset, all parameters are set to the factory settings:

To reset the device to factory settings:

- ▶ Select [Firmware] menu.
- > The menu page shows the current settings.
- ▶ Click on [Factory Reset] to reset the device.
- > LR DEVICE sets the device to the factory settings.

9.1.14 Firmware: Reboot the device

33832

When rebooting the device, all settings are kept.

To restart the AL1320:

- ▶ Select [Firmware] menu.
- > The menu page shows the current settings.
- ▶ Click on [Reboot] to reboot the device.
- > LR DEVICE reboots the ifm IO-Link master.

9.1.15 Configure IO-Link devices

To configure the IO-Link devices connected to the device with the LR DEVICE parameter setting software:

Requirements:

- > IO-Link master is correctly installed and connected to the LR DEVICE parameter setting software.
- > The IO-Link device is connected correctly with the AL1320.
- > Operating mode of the IO-Link port is "IO-Link" (→ **IO-Link ports: Configure operating mode** (→ p. [32](#))).
- > IoT has write access rights to the IO-Link master (→ **IoT: Configuring access rights** (→ p. [27](#))).

1 Select IO-Link master

- ▶ Start LR DEVICE.
- ▶ Update IODD file library
OR:
Import IODD file of the IO-Link device manually.
- ▶ Scan network for devices.
- > LR DEVICE detects IO-Link master.

2 Add IO-Link device

- ▶ Under [ONLINE]: Click on the required IO-Link master.
- > LR DEVICE automatically detects the IO-Link devices connected to the IO-Link master (e.g. ifm sensor KG5065).

ONLINE	
Devices	+
AL1nnn	○
Port 1: KG5065	✎
Port 2	✎
Port 3	✎

3 Configure IO-Link device

- ▶ Mouse click on the port to which the IO-Link device is connected.
- > LR DEVICE reads and shows the current parameter values of the IO-Link device.
- ▶ Configure IO-Link device.

Information about the available parameters of the IO-Link device: → IO Device Description (IODD) des IO-Link Devices

- ▶ Save the changed configuration on the IO-Link device.

IoT Core: General information

52256

The DataLine device family has an IoT Core. The IoT Core allows the user to address the AL1320 from IT networks via a REST API and to integrate it into Internet-of-Things applications.

A device description is stored on the AL1320. This device description is a structured, machine-readable data object in JSON format. All current values of parameters, process data, diagnostic data and device information are mapped in this data object. These data values can be read and changed by means of services.

Access the ifm IoT Core

The user can access the ifm IoT Core via HTTP requests. The following request methods are available.

GET request

Using the GET method the user has read access to a data point.

The syntax of the request to the IoT Core is:

`http://ip/datapoint/service`

Parameter	Description
ip	IP address of the IoT interface
data_point	Data point which is to be accessed
service	Service

The syntax of the return of the IoT Core is:

```
{
  "cid":id,
  "data":{"value":resp_data},
  "code":diag_code
}
```

Parameter	Description
id	Correlation ID for the assignment of request and return
resp_data	Value of the data point; depending on the data type of the data point
diag_code	Diagnostic code (→ IoT Core: Diagnostic codes (→ p. 42))

Example: GET request

Request (via browser):

`http://192.168.0.250/devicetag/applicationtag/getdata`

Response:

```
{
  "cid":-1,
  "data":{"value":"AL1320"},
  "code":200
}
```

POST request

Using a POST request the user has read and write access to a data point.

The syntax of the request to the IoT Core is:

```
{
  "code": "code_id",
  "cid": id,
  "adr": "data_point/service",
  "data": {req_data},
  "auth": {"user": "usr_id", "passwd": "password"}
}
```

Field	Parameter	Description	
code	code_id	Service class	
		▪ request	Request
		▪ transaction	Transaction
		▪ event	Event
cid	id	Correlation ID for the assignment of request and response; ID freely assignable by the user	
adr	data_point	Data point of the element tree which is to be accessed	
	service	Service to be performed (→ Overview: IoT services (→ p. 157))	
data*	req_data	Data to be transferred to the IoT Core (e.g. new values); syntax depending on the service	
auth**	usr_id	user name (base64 coded); default value: administrator	
	password	password (base64 coded)	

* = optional; only required for services, that submit data to the IoT core (e. g. setdata)

** = optional; only required, if security mode is activated

The syntax of the return of the IoT Core is:

```
{
  "cid": id,
  "data": {resp_data},
  "code": diag_code
}
```

Field	Parameter	Description
cid	id	Correlation ID for the assignment of request and response (see request)
data*	resp_data	Value of the data point; syntax depending on the service
code	diag_code	Diagnostic code (→ IoT Core: Diagnostic codes (→ p. 42))

* = optional; only required for services, that receive data from the IoT core (e.g. getdata)

Example: POST request

Request:

```
{
  "code": "request",
  "cid": 4711,
  "adr": "devicetag/applicationtag/getdata"
}
```

Response:

```
{  
  "cid":4711,  
  "data":{"value":"AL1320"},  
  "code":200  
}
```

IoT Core: Diagnostic codes

Code	Text	Description
200	OK	Request successfully processed
230	OK but needs reboot	Request successfully processed; IO-Link master must be restarted
231	OK but block request not finished	Request successfully processed; blockwise request, but not yet finished
232	Data has been accepted, but internally modified	New values have been accepted, but were adjusted by the IO-Link master (Master cycle time)
233	IP settings (of IoT-Port) have been updated. Application needs to reload device. Wait at least 1 second before reloading device.	IP settings have been successfully changed, IO-Link master will be reloaded; wait for at least 1 second
400	Bad request	Invalid request
401	Unauthorized	Non authorised request
403	Forbidden	Forbidden request
500	Internal Server Error	Internal fault
503	Service Unavailable	The service is not available (e. g. IO-Link port in wrong operating mode; no IO-Link device at IO-Link port)
530	The requested data is invalid	Invalid process data
531	IO-Link error	Error in IO-Link Master / device
532	PLC connected Error	Error while setting data, because IO-Link master is still connected to fieldbus PLC

9.2.2 First steps

To read the device description of the AL1320:

- ▶ Send the following POST request to the AL1320:
`{"code": "request", "cid": -1, "adr": "gettree"}`
- > AL1320 returns the device description as structured JSON object.
- ▶ Identify all substructures and the data points contained therein in the tree structure of the JSON object.
- ▶ Identify the applicable services for the access to substructures and the data points contained therein.

9.2.3 General functions

The AL1320 has the type device (→ **Overview: IoT types** (→ p. [156](#))).

The following services can be used on the root element of the type device:

Service	Description
./gettree	Provide the complete tree or subtree of the device description (JSON)
./getidentity	Reading device information
./getdatamulti	Reading several parameter values sequentially
./getelementinfo	Reading detailed information of an element
./getsubscriberlist	Print a list of all active notification subscriptions
./querytree	Search device description for specific elements

Depending on the read and write access rights, the following services can be applied to elements of type data:

Service	Description
./getdata	Reading the value of the element
./setdata	Write the value of the element

Example: Reading properties of an element

Task: Determine the data type and value range of the `accessrights` parameter.

Solution: Read the properties of the element `iotsetup/accessrights` of the `getelementinfo` service. The fields `type` (data type) and `valuation` (range of values) contain the required information.

- Request:

```
{
  "code": "request",
  "cid": 4711,
  "adr": "getelementinfo",
  "data": {"adr": "iotsetup/accessrights"}
}
```

- Response:

```
{
  "cid": 4711,
  "data": {
    "identifier": "accessrights",
```

```

"type": "data",
"uid": null,
"profiles": ["parameter"],
"format": {
  "type": "enum",
  "namespace": "json",
  "encoding": "integer",
  "valuation": {
    "valuelist": {
      "0": "Fieldbus + IoT",
      "1": "Fieldbus + IoT (read-only)",
      "3": "IoT only"
    }
  },
  "code": 200
}

```

The accessrights parameter has the data type ENUM with the valid values "Fieldbus + IoT", "Fieldbus + IoT (read only)" and "IoT only".

Example: output subtree

61149

Task: Output all direct sub-elements of the node `firmware`.

Solution: Use the service `gettree` to output the required subtree (root node: `firmware`, sub-levels to be shown: 1)

- Request:

```
{
  "code": "request",
  "cid": 4711,
  "adr": "gettree",
  "data": {
    "adr": "firmware",
    "level": 1
  }
}
```

- Response:
- ```
{
 "cid": 4711,
 "data": {
 "identifier": "firmware",
 "type": "structure",
 "profiles": [
 "software", "software/uploadablesoftware"
],
 "subs": [
 {
 "identifier": "version", "type": "data", "profiles": ["parameter"],
 "format": {"type": "string", "namespace": "json", "encoding": "UTF-8"},

 {
 "identifier": "type", "type": "data",
 "format": {"type": "string", "namespace": "json", "encoding": "UTF-8"},

 {
 "identifier": "install", "type": "service",
 {
 "identifier": "factoryreset", "type": "service",
 {
 "identifier": "signal", "type": "service",
 {
 "identifier": "container", "type": "data",
 "format": {"type": "binary", "namespace": "json", "encoding": "base64"}
 }
 }
 }
 }
 }
 }
]
 }
}
```

```
{
 "identifier": "reboot", "type": "service"}]
},
"code": 200
}
```

## Example: Read several parameter values of the IO-Link master simultaneously

33840

**Task:** The following current values are to be read by the IO-Link master: temperature, serial number

**Solution:** Read the current parameter values using the getdatamulti service (data point temperature: /processdatamaster/temperature; data point serial number: /deviceinfo/serialnumber)

- Request:

```
{
 "code": "request",
 "cid": 4711,
 "adr": "/getdatamulti",
 "data": {"dataosend": ["/processdatamaster/temperature", "/deviceinfo/serialnumber"]}
}
```

- Response:

```
{
 "cid": 4711,
 "data": {"processdatamaster/temperature": {"code": 200, "data": 44},
 "deviceinfo/serialnumber": {"code": 200, "data": "000174210147"}},
 "code": 200
}
```

## Example: Browsing device description

61150

**Task:** List all elements with the designation "status" and the profile "runcontrol".

**Solution:** Use the service querytree to browse the device description with the parameters "status" (name) and "runcontrol" (profile)

- Request:

```
{
 "cid": 4711,
 "adr": "querytree",
 "code": "request",
 "data": {
 "profile": "runcontrol",
 "name": "status"
 }
}
```

- Response:

```
{
 "cid": 4711,
 "data": {
 "adrList": [
 "device/connections/mqttConnection/status",
 "device/connections/mqttConnection/mqttCmdChannel/status"
],
 "code": 200
 }
}
```

## Setting the storage duration

61153

The IoT Core offers the possibility to set the storage duration of data and notifications. The Services **Service: setdata** (→ p. [167](#)) and **Service: subscribe** (→ p. [169](#)) therefore have the parameter "duration".

### Example: Subscribing to notifications

61154

**Task:** The current values of the following parameters are to be sent regularly to a network server with IP address 192.168.0.4:

- Product name of the IO-Link Devices an IO-Link port X02
- Cyclic input data of the IO-Link Devices an IO-Link port X02
- Operating temperature of the IO-Link master.

The subscription is only to be active until the next restart of the IO-Link master.

**Solution:** Subscribe to the required data using the subscribe service.

- Request:

```
{
 "code": "request",
 "cid": 4711,
 "adr": "/timer[1]/counter/datachanged/subscribe",
 "data": {
 "callback": "http://192.168.0.4:80/temp",
 "datatosend": [
 "/iolinkmaster/port[2]/iolinkdevice/productname",
 "/iolinkmaster/port[2]/iolinkdevice/pdin",
 "/processdatamaster/temperature"],
 "duration": "uptime"
 }
}
```

- Response:

```
{
 "cid": 4711,
 "code": 200
}
```

## 9.2.4 IoT: Configuring access rights

Substructure: iotsetup

Available data points:

| Name            | Description                         | Access |
|-----------------|-------------------------------------|--------|
| ../accessrights | Access rights to the IO-Link master | rw     |

rw ... read and write

-  If in IoT and EtherNet/IP projection software the parameter [Access Rights] is = [EtherNet/IP + IoT], the parameter values set in the EtherNet/IP projection software will always apply.
- If in IoT the parameter [Access Rights] is = [IoT only], set the parameter [Access Rights] = [Keep settings] in the EtherNet/IP projection software.
- If in LR DEVICE the parameter [Access Rights] is = [EtherCAT + IoT (read-only)], write access to the device configuration via LR DEVICE and IoT core services is blocked. To enable write access again, set the parameter to [EtherCAT + IoT] via fieldbus configuration software.
- Changes of the parameter [Access Rights] will only be effective after restarting the IO-Link master (→ **Firmware: Reboot the device** (→ p. [35](#))).

## 9.2.5 IoT: Configuring IP settings

Substructure: iotsetup

Available data points:

| Name                        | Description                                      | Access |
|-----------------------------|--------------------------------------------------|--------|
| ../network/dhcp             | Configuration of the IP settings of the IoT port | rw     |
| ../network/ipaddress        | IP address of the IoT port                       | rw     |
| ../network/subnetmask       | Subnet mask of the network segment               | rw     |
| ../network/ipdefaultgateway | IP address of the network gateway                | rw     |

rw ... read and write

Applicable services:

| Name                | Description                                    |
|---------------------|------------------------------------------------|
| ../network/setblock | Write all values of the substructure blockwise |

-  Change the IP parameters in the substructure network only blockwise with the setblock service!

## 9.2.6 IoT: Configuring the LR AGENT or LR SMARTOB SERVER interface

59786

Substructure: iotsetup

Available data points:

| Name           | Description                                                                  | Access |
|----------------|------------------------------------------------------------------------------|--------|
| ./smobip       | IP address of the LR SMARTOB SERVER                                          | rw     |
| ./smobport     | Port number of the LR SMARTOB SERVER                                         | rw     |
| ./smobinterval | Cycle time for data transmission to LR SMARTO SERVER (value in milliseconds) | rw     |

rw ... read and write

## 9.2.7 IoT: Configuring security mode

54683

The access to the IoT interface of the IO-Link master can be protected with a security mode:

Substructure: iotsetup

Available data points:

| Name                    | Description                                | Access |
|-------------------------|--------------------------------------------|--------|
| ./security/securitymode | active security mode                       | rw     |
| ./security/password     | Password for authentication (Base64 coded) | w      |

rw ... read and write

w ... write only

Valid character set for the Base64 coding / decoding of the password: UTF-8

Online tool for coding / decoding: → [www.base64encode.org](http://www.base64encode.org)

### Note: Security mode

54684

The security mode enables restricting access to the IO-Link master and the connected IO-Link devices from the IT network. In the activated security mode, the following restrictions apply:

- Access only with authentication (password-protected user account)
- Access only via secure https connection (Transport Layer Security - TLS)

The security mode only protects the access to the device via the IoT interface.

The standard value for users is: administrator

The set password cannot be read with getdata.

The current status of the security function can be read with the getidentity service (→ **Servicet: getidentity** (→ p. 160)).For the authentication, the user must additionally provide the POST requests with a valid user name and password in the field "auth". The user name and the password will be shown as Base64-coded character strings (→ **Example: Request with authentication** (→ p. 49)).

The following requests can be done if the security mode is enabled, also without authentication:

- /getidentity
- /deviceinfo/vendor/getdata
- /deviceinfo/productcode/getdata

## Example: Activate security mode

**Task:** Activate the security mode of the IO-Link interface of the IO-Link master. Set the password "password" (Base64 coded: cGFzc3dvcmQ=)

**Solution:** The activation consists of 2 steps:

### 1 Activate security mode

Use service setdata with datapoint iotsetup/security/securitymode to activate the security mode.

- Request:

```
{
 "code": "request",
 "cid": -1,
 "adr": "/iotsetup/security/securitymode/setdata",
 "data": {"newvalue": "1"}
}
```

- Response:

```
{
 "cid": -1,
 "code": 200
}
```

### 2 Set required password

Use service setdata with data point iotsetup/security/password to set the required password.

- Request:

```
{
 "code": "request",
 "cid": -1,
 "adr": "/iotsetup/security/password/setdata",
 "data": {"newvalue": "cGFzc3dvcmQ="}
}
```

- Response:

```
{
 "cid": -1,
 "code": 200
}
```

## Example: Request with authentication

**Task:** The temperature of the IO-Link master is to be read. The security function is enabled (current password: password).

**Solution:** Read the data point processdatamaster/temperature with the getdata service. The request must be sent using https. The user name and the password are transferred as a Base64-coded character string ("administrator" = "YWRtaW5pc3RyYXRvcg==", "password" = "cGFzc3dvcmQ=")

- Request:

```
{
 "code": "request",
 "cid": -1,
 "adr": "processdatamaster/temperature/getdata",
 "auth": {"user": "YWRtaW5pc3RyYXRvcg==", "passwd": "cGFzc3dvcmQ="}
}
```

- Response:

```
{
 "cid": -1,
 "data": {"value": 37},
 "code": 200
}
```

## Example: reset password

54686

**Task:** The existing password is to be reset.

**Solution:** To reset a password, disable the security mode. To disable it, enter the user name and the password (the fields "user" and "passwd").

- Request:

```
{
 "code": "request",
 "cid": -1,
 "adr": "iotsetup/security/securitymode/setdata",
 "data": {"newvalue": 0},
 "auth": {"user": "YWRtaW5pc3RyYXRvcg==", "passwd": "SW9UNG1mbQ=="}
}
```

- Response:

```
{
 "cid": -1,
 "code": 200
}
```

## 9.2.8 Fieldbus: Configuring IP settings

Substructure: `fieldbussetup`

Available data points:

| Name                                     | Description                                                | Access           |
|------------------------------------------|------------------------------------------------------------|------------------|
| <code>../hostname</code>                 | Name of the IO-Link master in the fieldbus project         | <code>rw</code>  |
| <code>../fieldbusfirmware</code>         | Firmware version of the IO-Link master                     | <code>r</code>   |
| <code>../network/macaddress</code>       | MAC address of the fieldbus port                           | <code>r</code>   |
| <code>../network/ipaddress</code>        | IP address of the fieldbus port                            | <code>rw*</code> |
| <code>../network/subnetmask</code>       | Subnet mask of the network segment                         | <code>rw*</code> |
| <code>../network/ipdefaultgateway</code> | IP address of the network gateway                          | <code>rw*</code> |
| <code>../network/dhcp</code>             | Configuration of the IP settings of the fieldbus interface | <code>rw</code>  |
| <code>../connectionstatus</code>         | Status of the connection to the EtherNet/IP network        | <code>r</code>   |

`r` ... read only

`rw` ... read and write

\* ... only changeable, if the EtherNet/IP controller is not in RUNNING state

Applicable services:

| Name                             | Description                                  |
|----------------------------------|----------------------------------------------|
| <code>../network/setblock</code> | Write all values of the substructure at once |

Change the IP parameters in the substructure network only blockwise by using the service `setblock`!

## 9.2.9 Fieldbus: Selecting the configuration mode

Substructure: `fieldbussetup/configuration`

Available data points:

| Name                                     | Description                                              | Access |
|------------------------------------------|----------------------------------------------------------|--------|
| <code>../independentmode</code>          | Set the configuration mode (Top-down, Independent)       | r/w*   |
| <code>../explicitpdmode</code>           | Connection types                                         | r/w*   |
| <code>../processdataconfiguration</code> | Length of the process input data and process output data | r/w*   |
| <code>../configuration/swap</code>       | Byte order of process data                               | r/w*   |

rw ... read and write

\* ... only changeable, if the EtherNet/IP controller is not in RUNNING state

## 9.2.10 Fieldbus: Setting fail-safe values

Substructure: `fieldbussetup/configuration/port[n]` (n = 1...4)

Available data points:

| Name                               | Description                                               | Access |
|------------------------------------|-----------------------------------------------------------|--------|
| <code>../failsafedigitalout</code> | Fail-safe value for the digital output - pin 4 (DO)       | r/w*   |
| <code>../failsafeiolink</code>     | Fail-safe value for IO-Link output data - pin 4 (IO-Link) | r/w*   |

rw ... read and write

\* ... can only be changed if EtherNet/IP PLC is not in RUNNING state

## 9.2.11 IO-Link ports: Setting the operating mode of pin 4 (US)

Substructure: `iolinkmaster/port[n]` (n = 1...4).

Available data points:

| Name                                   | Description                                                               | Access |
|----------------------------------------|---------------------------------------------------------------------------|--------|
| <code>../mode</code>                   | Operating mode of the IO-Link port                                        | r/w*   |
| <code>../mastercycletime_preset</code> | Cycle time of the data transfer at the IO-Link port (value in ms)         | r/w*   |
| <code>../mastercycletime_actual</code> | Current cycle time of the data transfer at the IO-Link port (value in ms) | r      |
| <code>../comspeed</code>               | Data transfer rate of the IO-Link port                                    | r      |

r ... read only

rw ... read and write

\* ... only changeable, if the <Fieldbus> plc is not in RUNNING state

## 9.2.12 IO-Link ports: Configuring device validation and data storage

Substructure: `iolinkmaster/port[n]` ( $n = 1 \dots 4$ ).

Available data points:

| Name                                        | Description                                                         | Access           |
|---------------------------------------------|---------------------------------------------------------------------|------------------|
| <code>../validation_datastorage_mode</code> | Response of the IO-Link port when a new IO-Link device is connected | <code>rw*</code> |
| <code>../validation_vendorid</code>         | IO-Link ID of the manufacturer that is to be validated              | <code>rw*</code> |
| <code>../validation_deviceid</code>         | IO-Link ID of the device that is to be validated                    | <code>rw*</code> |
| <code>../datastorage</code>                 | Structure for port data storage                                     | <code>rw</code>  |
| <code>../datastorage/maxsize</code>         | Maximum size of the data storage content (in bytes)                 | <code>r</code>   |
| <code>../datastorage/chunksize</code>       | Size of a data segment (in bytes)                                   | <code>r</code>   |
| <code>../datastorage/size</code>            | Size of the data storage content (in bytes)                         | <code>r</code>   |

`r` ... read only

`rw` ... read and write

\* ... can only be changed if the EtherNet/IP PLC is not in RUNNING state

Applicable services:

| Service                                       | Description                                                |
|-----------------------------------------------|------------------------------------------------------------|
| <code>../validation_useconnecteddevice</code> | Validate the IO-Link device connected to the IO-Link port* |
| <code>../datastorage/getblobdata</code>       | Reading the content of the data storage area               |
| <code>../datastorage/stream_set</code>        | Transfer an individual data segment*                       |
| <code>../datastorage/start_stream_set</code>  | Start sequential transmission of several data segments*    |

\* ... can only be changed if the EtherNet/IP PLC is not in the RUNNING state

### Example: Clone the Data Storage of an IO-Link port

**Task:** Save the Data Storage of IO-Link port X02 of IO-Link master 1 and restore the data at IO-Link master 2.

**Solution:** The cloning process consists of 2 steps. In the first step, the Data Storage of the IO-Link port of IO-Link master 1 is saved. In the second step, the saved data is restored at the Data Storage of port IO-Link port of IO-Link master 2.

Save Data Storage:

#### 1 Preparations

- ▶ Read size of segments of Data Storage ( $h$  = number of bytes):  
`{"code": "request", "cid": -1, "adr": "/iolinkmaster/port[2]/datastorage/chunksize/getdata"}`  
Example:  $h = 256$

- ▶ Read total size of Data Storage area ( $g$  = number of bytes):  
`{"code": "request", "cid": -1, "adr": "/iolinkmaster/port[2]/datastorage/size/getdata"}`  
Example:  $g = 550$

- ▶ Calculate the number of reading steps  $n$ :  $n = \text{first integer value to which the following applies: } g < n \cdot h$   
Example:  $n = 3$ , because  $550 < 3 \cdot 256$

#### 2 Read Data Storage of IO-Link port

- ▶ Read Data Storage segment by segment ("pos" is the byte offset, at which the reading process with length "length" starts).  
`{"code": "request", "cid": -1, "adr": "/iolinkmaster/port[2]/datastorage/getblobdata", "data": {"pos": 0, "length": h}}`

```
{ "code": "request", "cid": -1, "adr": "/iolinkmaster/port[2]/datastorage/getblobdata", "data": {"pos": h, "length": h} }
{ "code": "request", "cid": -1, "adr": "/iolinkmaster/port[2]/datastorage/getblobdata", "data": {"pos": 2*h, "length": h} }
```

...

```
{"code": "request", "cid": -1, "adr": "/iolinkmaster/port[2]/datastorage/getblobdata", "data": {"pos": n*h, "length": h}}
```

Example:

1st read request: pos = 0, length = 256

2nd read request: pos = 256, length = 256

3rd read request: pos = 512, length = 256

- > Each segment value will be returned as BASE64 coded string.

- ▶ Join segments.

Restore Data Storage:

## 1 Preparations

- ▶ Determine the size of the saved Data Storage value (n = number of bytes).

Example: n = 550

- ▶ Read size of segments (s = number of bytes):

```
{"code": "request", "cid": -1, "adr": "/iolinkmaster/port[1]/datastorage/chunksize/getdata"}
```

Example: s = 256

## 2 Transfer Data Storage strings

- ▶ Start transfer of Data Storage string ("size" = size of Data Storage string):

```
{"code": "request", "cid": -1, "adr": "/iolinkmaster/port[1]/datastorage/start_stream_set", "data": {"size": n}}
```

Example: size = 550

- ▶ Transfer Data Storage string segment by segment ("value" = string value of length s):

```
{"code": "request", "cid": -1, "adr": "/iolinkmaster/port[1]/datastorage/stream_set", "data": {"value": "aWZtfgIAAABBTDF4NXhfY25faXRfdDluMi43Nw..."}}
```

## 9.2.13 IO-Link ports: Configuring data transfer to LR AGENT or LR SMARTOBSERVER

59795

Substructure: `iolinkmaster/port[n]` ( $n = 1 \dots 4$ ).

Available data points:

| Name                           | Description                                  | Access          |
|--------------------------------|----------------------------------------------|-----------------|
| <code>../senddatatosmob</code> | Process data to LR AGENT or LR SMARTOBSERVER | <code>rw</code> |

`rw` ... read and write

## 9.2.14 IO-Link ports: Reading / writing process data

61156

Substructure: `iolinkmaster/port[n]` ( $n = 1 \dots 4$ )

Available data points:

| Name                               | Description                                              | Access           |
|------------------------------------|----------------------------------------------------------|------------------|
| <code>../pin2in</code>             | Value of the digital input on pin 2 of the IO-Link port  | <code>r</code>   |
| <code>../iolinkdevice/pdin</code>  | Value of the IO-Link input on pin 4 of the IO-Link port  | <code>r</code>   |
| <code>../iolinkdevice/pdout</code> | Value of the IO-Link output on pin 4 of the IO-Link port | <code>rw*</code> |

`r` ... read only`rw` ... read and write

\*... can only be changed if the fieldbus PLC is not in RUNNING state

### Example: Read IO-Link process data (operating mode "IO-Link")

33842

**Task:** Read the current measured value of the ifm temperature sensor TN2531 at IO-Link port X02**Solution:** Read the data point for the process input data with the `getdata` service.

- Request:

```
{
 "code": "request",
 "cid": 4711,
 "adr": "/iolinkmaster/port[2]/iolinkdevice/pdin/getdata"
}
```

- Response:

```
{
 "cid": 4711,
 "data": {"value": "03C9"},
 "code": 200
}
```

The return value is given in hexadecimal format. Besides the temperature value the return value comprises additional information (→ IO Device Description (IODE) of the sensor). The temperature value is shown in bits 2 to 15.

0x03C9 = 0b1111001001

Temperature value: 0b11110010 = 242

Therefore: The current temperature value is 24.2 °C.

### Example: Writing IO-Link value (operating mode "IO-Link")

59804

**Task:** Switch on the buzzer of DV2500 at IO-Link Port X2. The DV2500 operates in On/Off mode.

**Solution:** The IODD of the DV2500 shows the structure of the IO-Link process value (→ e.g. LED activity). The buzzer will be switched using bit 40 of the process value (OFF = 0, ON = 1).

To switch the buzzer:

1. Read the current process value (→ **Example: Read IO-Link process data (operating mode "IO-Link")** (→ p. [55](#))).
2. Set bit 40 of the read value to 1.
3. Write the process value to the IO-Link device.

Example:

Read process value:

0x0000 0000 004D = 0b0000 0000 0000 0000 0000 0000 0000 0000 0000 0000 0100 1101

New process value:

0b0000 0001 0000 0000 0000 0000 0000 0000 0000 0000 0100 1101 = 0x0100 0000 004D

- Request:

```
{
 "code": "request",
 "cid": 10,
 "adr": "iolinkmaster/port[2]/iolinkdevice/pdout/setdata",
 "data": {"newvalue": "0100000004D"}
}
```

- Response:

```
{
 "cid": 10,
 "code": 200
}
```

## Example: Writing digital output (operating mode "DO")

59803

**Task:** Set the output value of the IO-Link devices at IO-Link Port X1 to "ON". The operating mode of the IO-Link port is "Digital Output (DO)".

**Solution:** Write the value 1 to data point pdout. The value has to be written as hexadecimal value with a length of 1 byte (OFF = "00", ON = "01").

- Request:

```
{
 "code": "request",
 "cid": 10,
 "adr": "iolinkmaster/port[1]/iolinkdevice/pdout/setdata",
 "data": {"newvalue": "01"}
}
```

- Response:

```
{
 "cid": 10,
 "code": 200
}
```

**Task:** Read the current input value of the IO-Link device at IO-Link port X5. The operating mode of the IO-Link port is "Digital Input (DI)".

**Solution:** Read the value of data point pdin. The value will be returned as hexadecimal value with a length of 1 byte (OFF = "00", ON = "01").

- Request:

```
{
 "code": "request",
 "cid": 10,
 "adr": "iolinkmaster/port[5]/iolinkdevice/pdin/getdata"
}
```

- Response:

```
{
 "cid": 10,
 "data": {"value": "00"},
 "code": 200
}
```

## 9.2.15 IO-Link ports: Indicating port events

Substructure: iolinkmaster/port[n] (n = 1...4).

Available data points:

| Name         | Description                                                                                                                                                                                                            | Access |
|--------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------|
| ../portevent | Indication of the following events at IO-Link port n: <ul style="list-style-type: none"> <li>▪ plugging IO-Link device</li> <li>▪ pulling IO-Link device</li> <li>▪ changing operating mode of IO-Link port</li> </ul> | r      |

r ... read only

Subscribing events: → **Subscribing to notifications** (→ p. [64](#))

## 9.2.16 IO-Link devices: Accessing parameters

The ifm IoT Core supports the configuration of the connected IO-Link devices. A parameter is accessed via IO-Link index and subindex (→ IO Device Description (IODD) of the device).

Substructure: `iolinkmaster/port[n]/iolinkdevice` ( $n = 1 \dots 4$ )

Applicable services:

| Service                         | Description                                      |
|---------------------------------|--------------------------------------------------|
| <code>../iolreadacyclic</code>  | Read a parameter of an IO-Link device (acyclic)  |
| <code>../iolwriteacyclic</code> | Write a parameter of an IO-Link device (acyclic) |

### Example: Read the parameter value of an IO-Link device

**Task:** Read the serial number of the ifm temperature sensor TN2531 at IO-Link port X02

**Solution:** Read the serial number with the `iolreadacyclic` service from the IO-Link device (index: 21, subindex: 0)

- **Request:**

```
{
 "code": "request",
 "cid": 4711,
 "adr": "/iolinkmaster/port[2]/iolinkdevice/iolreadacyclic",
 "data": {"index": 21, "subindex": 0}
}
```

- **Return:**

```
{
 "cid": 4711,
 "data": {"value": "4730323134323830373130"},
 "code": 200
}
```

The returned value is given in hexadecimal format. The conversion of the HEX value in a STRING value is: G0214280710

### Example: Change the parameter value of an IO-Link device

**Task:** Set the output configuration OUT1 of the ifm temperature sensor TN2531 at IO-Link port X02 to the value "Hnc / hysteresis function, normally closed".

**Solution:** Change the parameter [ou1] of the sensor to the value 4 using the `iolwriteacyclicdata` service. The parameter can be accessed via IO-Link index 580, subindex 0 (→ IO-Link description of the sensor).

- Request:

```
{
 "code": "request",
 "cid": 4711,
 "adr": "/iolinkmaster/port[2]/iolinkdevice/iolwriteacyclic",
 "data": {"index": 580, "subindex": 0, "value": "34"}
}
```

The value has to be given in hexadecimal format. The conversion of the STRING value in a HEX value is: 34.

- Response:

```
{
"cid":4711,
"code":200
}
```

## 9.2.17 IO-Link devices: Reading and writing device information

59797

Substructure: `iolinkmaster/port[n]/iolinkdevice (n = 1...4)`

Available data points:

| Name                                   | Description                                      | Access |
|----------------------------------------|--------------------------------------------------|--------|
| <code>../status</code>                 | Status of the connected IO-Link device           | r      |
| <code>../vendorid</code>               | IO-Link ID of the vendor                         | r      |
| <code>../deviceid</code>               | IO-Link ID of the IO-Link device                 | r      |
| <code>../productname</code>            | Product name of the IO-Link device               | r      |
| <code>../serial</code>                 | Serial number of the IO-Link device              | r      |
| <code>../applicationspecifictag</code> | Device-specific identification (application tag) | rw     |

r ... read only

rw ... read and write

## 9.2.18 IO-Link devices: Indicating IO-Link events

59798

Substructure: `iolinkmaster/port[n]/iolinkdevice (n = 1...4)`.

Available data points:

| Name                        | Description                  | Access |
|-----------------------------|------------------------------|--------|
| <code>../iolinkevent</code> | Indication of IO-Link events | r      |

r ... read only

Subscribing events: → **Subscribing to notifications** (→ p. [64](#))

## 9.2.19 Gateway: Resetting, rebooting and localising the device

59790

Substructure: `firmware`

Applicable services:

| Name                         | Description                              |
|------------------------------|------------------------------------------|
| <code>../factoryreset</code> | Reset IO-Link master to factory settings |
| <code>../reboot</code>       | Reboot IO-Link master                    |
| <code>../signal</code>       | Trigger the flashing of the status LED   |

## 9.2.20 Gateway: Reading device information

Substructure: deviceinfo

Available data points:

| Name                  | Description                     | Access |
|-----------------------|---------------------------------|--------|
| ../productcode        | Article number                  | r      |
| ../vendor             | Manufacturer                    | r      |
| ../devicefamily       | Device family                   | r      |
| ../hwrevision         | Hardware revision               | r      |
| ../serialnumber       | Serial number                   | r      |
| ../revision           | Firmware version                | r      |
| ../bootloaderrevision | Bootloader version              | r      |
| ../extensionrevisions | Firmware and bootloader version | r      |
| ../fieldbusstype      | Fieldbus                        | r      |

r ... read only

Additional information about the AL1320 can be read with the service getidentity (→ **Servicet: getidentity** (→ p. [160](#))).

## 9.2.21 Gateway: Reading status and diagnostic information

Substructure: processdatamaster

Available data points:

| Name                 | Description                                                  | Access |
|----------------------|--------------------------------------------------------------|--------|
| ../temperature       | Temperature of the IO-Link master (value in °C)              | r      |
| ../voltage           | Present voltage value of the supply voltage US (value in mV) | r      |
| ../current           | Present current value of the sensor supply US (value in mA)  | r      |
| ../supervisionstatus | Status of the device supply US                               | r      |

r ... read only

## 9.2.22 Gateway: Updating the firmware

Substructure: **firmware**

Available data points:

| Name                  | Description                                        | Access |
|-----------------------|----------------------------------------------------|--------|
| ./version             | Software version                                   | r      |
| ./type                | Software type                                      | r      |
| ./container           | Structure for updating the firmware                | w      |
| ./container/maxsize   | Maximum size of the container structure (in bytes) | r      |
| ./container/chunksize | Size of a data segment (in bytes)                  | r      |
| ./container/size      | Size of the container content (in bytes)           | r      |

r = only read  
w = write only

Applicable services:

| Name                         | Description                                            |
|------------------------------|--------------------------------------------------------|
| ./install                    | Install firmware transferred to the IO-Link master     |
| ./container/stream_set       | Transfer an individual data segment                    |
| ./container/start_stream_set | Start sequential transmission of several data segments |

## Example: Update firmware

### Task:

Update the firmware of the device; size of the firmware file: 356676 bytes

### Solution:

The firmware is transferred to the device in fragments (chunks). The size of the fragments depends on the size of the flash memory of the IO-Link master. To transfer the firmware, the firmware file must be converted into a character string using BASE64.

#### 1 Preparations

- ▶ Determine the size of the fragments (g = number of bytes):  
`{"code": "request", "cid": -1, "adr": "/firmware/container/chunksize/getdata"}`
- ▶ Convert the firmware file into a BASE64 string.

#### 2 Start the transfer of the firmware

- ▶ Start the transfer of the firmware via the service start\_stream\_set (parameter "size": size of the firmware file):  
`{"code": "request", "cid": -1, "adr": "/firmware/container/start_stream_set", "data": {"size": 356676}}`

#### 3 Load the firmware into the flash memory of the IO-Link master

- ▶ Send the BASE64 string of the firmware file to the IO-Link master fragment by fragment (value = string value with length g).  
`{"code": "request", "cid": -1, "adr": "/firmware/container/stream_set", "cid": -1, "data": {"value": "aWZtfgIAAABBTDF4NXhfY25faXRfdDluMi43Nw..."}}`
- ▶ Repeat step 3 until all fragments of the firmware file have been sent to the IO-Link master.
- > IO-Link master stores the segments received in the container area.

#### 4 Install firmware

- ▶ Start the installation of the transmitted firmware.  
`{"code": "request", "cid": -1, "adr": "/firmware/install", "data": {}}`

## 9.2.23 Gateway: Setting the application tag

Substructure: devicetag

Available data points:

| Name              | Description                                  | Access |
|-------------------|----------------------------------------------|--------|
| ../applicationtag | Name of the IO-Link master (application tag) | rw     |

rw ... read and write

 For the storage of the applicationtag 32 bytes are available on the IO-Link master. If the memory area is exceeded during writing with setdata, the IoT core aborts the write process and returns the diagnostics code 400.

When writing the application tag, note the different memory requirements of the individual UTF-8 characters:

- characters 0-127: 1 byte per character
- characters >127: more than 1 byte per character

### Example: Change name of the IO-Link master

a33823

**Task:** Set the name of the IO-Link master to AL1320 for the representation in the LR SMARTOBSERVER.

**Solution:** Change the parameter [Application Tag] with the setdata service to the value [AL1320].

The data point of the parameter [Application Tag] in the device description object is /devicetag/applicationtag.

- Request:

```
{
 "code": "request",
 "cid": 4711,
 "adr": "/devicetag/applicationtag/setdata",
 "data": {"newvalue": "AL1320"}
}
```

- Response:

```
{"cid": 4711, "code": 200}
```

## 9.2.24 Subscribing to notifications

If a data point has the sub-element `datachanged`, the user can subscribe to notifications on value and condition changes. Notifications can be triggered by the expiration of a timer or an event. The IoT Core supports the output of notifications in CSV or JSON format.

Available data points:

| Name                                          | Description                                                                                                                                                       | Access |
|-----------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------|
| timer[x]/counter                              | Timer for triggering a notification                                                                                                                               | rw     |
| timer[x]/interval                             | Cycle time of the update of the subscribed values                                                                                                                 | rw     |
| iolinkmaster/port[n]/portevent                | Display of the following events on IO-Link port n:<br>▪ IO-Link device connected<br>▪ IO-Link device disconnected<br>▪ Operating mode of the IO-Link port changed | rw     |
| iolinkmaster/port[n]/iolinkdevice/iolinkevent | Display of IO-Link events                                                                                                                                         | rw     |

r ... read only

rw ... read and write

x = [1,2]

n = 1...4

Applicable services:

| Name                              | Description                          |
|-----------------------------------|--------------------------------------|
| ./datachanged/subscribe           | Subscribe to notification            |
| ./datachanged/unsubscribe         | Unsubscribe notification             |
| ./datachanged/getsubscriptioninfo | Show information about notifications |

Additionally, the user can use **Service: getsubscriberlist** (→ p. [161](#)) show all active subscriptions.

### Example: Subscribing to notifications

**Task:** The current values of the following parameters are to be sent regularly to a network server with IP address 192.168.0.4:

- cyclic input data of the IO-Link Devices an IO-Link port X02
- Operating temperature of the IO-Link master.

**Solution:** Subscribe to the required data using the subscribe service.

The following options are additionally available:

- via WebSockets (ws://): **Example: Subscribing notifications via WebSocket** (→ p. [68](#))
- via MQTT (mqtt://): **Example: Configuring the MQTT command channel** (→ p. [72](#))

- Request:

```
{
 "code": "request",
 "cid": 4711,
 "adr": "/timer[1]/counter/datachanged/subscribe",
 "data": {
 "callback": "http://192.168.0.4:80/temp",
```

```
"datatosend": [
 "/iolinkmaster/port[2]/iolinkdevice/pdin",
 "/processdatamaster/temperature"
]
}
```

In addition, the time interval of the timer[1] must be set to a value between 500 ms and 2147483647 ms.

- Request:

```
{
 "code": "request",
 "cid": 4712,
 "adr": "/timer[1]/interval/setdata",
 "data": {"newvalue": 500}
}
```

- Response:

```
{
 "cid": 4712,
 "code": 200
}
```

- Notification (JSON)

```
{
 "code": "event",
 "cid": 4711,
 "adr": "",
 "data": {
 "eventno": "6317",
 "srcurl": "/timer[1]/counter/datachanged",
 "payload": {
 "/timer[1]/counter": {"code": 200, "data": 1},
 "/processdatamaster/temperature": {"code": 200, "data": 39},
 "/iolinkmaster/port[2]/iolinkdevice/pdin": {"code": 200, "data": "03B0"}}
 }
}
```

## Example: Changing a subscription

61161

**Task:** The existing subscription ([Example: Subscribing to notifications](#) (→ p. 64)) is to be changed. Instead of the temperature of the IO-Link master, the operating voltage applied is to be transmitted.

**Solution:** Overwrite the existing subscription. For this purpose, the parameter values for "cid" and "callback" in the request must be the same as those of the existing subscription.

- Request:

```
{
 "code": "request",
 "cid": 4711,
 "adr": "/timer[1]/counter/datachanged/subscribe",
 "data": {
 "callback": "http://192.168.0.4:80/temp",
 "datatosend": [
 "/iolinkmaster/port[2]/iolinkdevice/pdin",
 "/processdatamaster/voltage"]
 }
}
```

## Example: Subscribing to notifications in CSV format

**Task:** Every 2 seconds, the current values of the following parameters are to be sent to a network server with the IP address 192.168.0.4

- cyclic IO-Link input data of the IO-Link device at port X02
- Operating temperature of the IO-Link master.

The data should be transmitted in CSV format (comma separator).

**Solution:**

- ▶ Use the subscribe service to subscribe to the required data and set the output format to "csv0".

Data in CSV format can only be sent via TCP protocol.

- Request:

```
{
 "cid": 1,
 "adr": "/timer[1]/counter/datachanged/subscribe",
 "code": "request",
 "callback": "tcp://192.168.50.59:1883/topic",
 "codec": "csv0",
 "data": {
 "datatosend": [
 "/iolinkmaster/port[2]/iolinkdevice/pdin",
 "/processdatamaster/temperature"]
 }
}
```

- ▶ Set the interval of the timer to 2 seconds:

- Request:

```
{
 "code": "request",
 "cid": 4712,
 "adr": "/timer[1]/interval/setdata",
 "data": {"newvalue": 2000}
}
```

The cyclically sent notification has the following structure:

/timer[1]/counter/datachanged,6317,200,1,200,39,200,03B0

## Example: Unsubscribing from notifications

**Task:** The existing subscription (**Example: Subscribing to notifications** (→ p. 64)) is to be deleted.

**Solution:** Use the unsubscribe service to delete the subscription. For this purpose, the value of the parameter "callback" in the request must be equal to the value of the existing subscription.

```
{
 "code": "request",
 "cid": 4711,
 "adr": "/timer[1]/counter/datachanged/unsubscribe",
 "data": {
 "callback": "http://192.168.0.4:80/temp"
 }
}
```

## Example: Checking subscriptions

Task: Information about the existing subscription (**Example: Subscribing to notifications** (→ p. 64))

(→ p. 64) Show **Example: Subscribing to notifications** (→ p. 64)).

Solution: Use the service getsubscriptioninfo and the parameter values cid, "adr" and "callback" of the existing subscription to retrieve the information.

- Request:

```
{
 "code": "request",
 "cid": 4711,
 "adr": "/timer[1]/counter/datachanged/getsubscriptioninfo",
 "data": {
 "callback": "http://192.168.0.4:80/temp"
 }
}
```

- Response:

```
{
 "cid": 4711,
 "data": {
 "callback": "http://192.168.0.4:80/temp",
 "datatosend": [
 "/iolinkmaster/port[2]/iolinkdevice/productname",
 "/iolinkmaster/port[2]/iolinkdevice/pdin",
 "/processdatamaster/temperature"]
 },
 "code": 200
 }
}
```

## 9.2.25 Using Web Socket

The IoT Core supports communication via WebSocket protocol. With Web Sockets, the user can establish a full-duplex communication channel via a TCP connection.

WebSockets can be used for the following services:

- subscribe / unsubscribe

 Maximum number of WebSocket connections: 8  
Fail-safe WebSocket connections (wss://) are not supported.

To transmit notifications via a WebSockets connection:

- ▶ Establish the WebSocket connection (e.g. "ws://192.168.0.55:80/websocket")
- Option 1: without parameter "callback"
- ▶ make subscribe/unsubscribe request without parameter "callback".
- > IoT-Core sends notifications about existing WebSocket connections.
- Option 2. with parameter "callback"
- ▶ make subscribe/unsubscribe requests with parameter "callback" ("ws:///myTopic").
- > IoT-Core sends notifications about existing WebSocket connections to the topic myTopic.

### Example: Subscribing notifications via WebSocket

**Task:** The current values of the following parameters are to be sent regularly to the data sink myTopic via an existing WebSocket connection:

- Product name of the IO-Link Devices an IO-Link port X02
- cyclic input data of the IO-Link Devices an IO-Link port X02
- Operating temperature of the IO-Link master.

**Solution:** Subscribe to the required data using the subscribe service.

- Request:

```
{
 "code": "request",
 "cid": 4711,
 "adr": "/timer[1]/counter/datachanged/subscribe",
 "data": {
 "callback": "ws:///myTopic",
 "datatosend": [
 "/iolinkmaster/port[2]/iolinkdevice/productname",
 "/iolinkmaster/port[2]/iolinkdevice/pdin",
 "/processdatamaster/temperature"
]
 }
}
```

If the notifications are to be transmitted via the existing WebSocket connection, but without a special data sink, the callback parameter is not required.

- Request:

```
{
 "code": "request",
 "cid": 4711,
 "adr": "/timer[1]/counter/datachanged/subscribe",
 "data": {
 "datatosend": [
 ...
]
 }
}
```

```
"/iolinkmaster/port[2]/iolinkdevice/productname",
"/iolinkmaster/port[2]/iolinkdevice/pdin",
"/processdatamaster/temperature"]}

## 9.2.26 MQTT support

The IoT Core supports the MQTT protocol. The protocol allows an MQTT client to communicate with the IoT Core via an MQTT broker to request and receive data. The IoT Core can publish data via the MQTT connection.

### Configuring the MQTT command channel

61169

To enable MQTT communication, the user needs to activate and configure an MQTT command channel.

Substructure: connections/mqttConnection

| Name                                                    | Description                                                                                                                                                                                                                                                                                                             | Access |
|---------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------|
| ../type                                                 | Type of the connection (MQTT)                                                                                                                                                                                                                                                                                           | r      |

Applicable services:

| Name                           | Description                     |
|--------------------------------|---------------------------------|
| ../status/start                | Enable MQTT                     |
| ../status/stop                 | Deactivate MQTT                 |
| ../status/reset                | Reset MQTT                      |
| ../mqttCmdChannel/status/start | Activate MQTT command channel   |
| ../mqttCmdChannel/status/stop  | Deactivate MQTT command channel |
| ../mqttCmdChannel/status/reset | Reset MQTT command channel      |

Notes on the states of an MQTT connection: **Note: Connection states** (→ p. [71](#))

To create an MQTT connection, perform the following steps in sequence:

Ensure that the MQTT broker can be reached and that the selected port of the MQTT broker is enabled for data transmission.

Max. number of simultaneous MQTT connections: 10

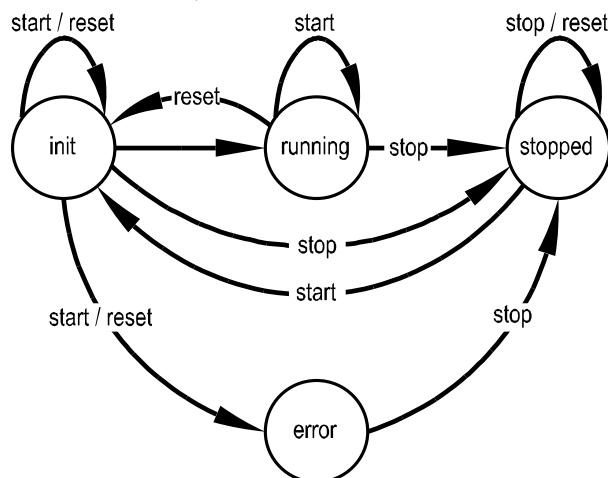

Wildcards "+" and "#" in topics are not supported.

- ▶ Activate MQTT command channel.
- ▶ Set the IP address of the MQTT.
- ▶ Set the port number of the MQTT broker.
- ▶ Set topic.
- ▶ Set standard response topic.
- > The command channel is created with the selected properties.
- > The user can publish on the topic with the IoT Core.
- > MQTT clients can subscribe to the topic.

### Note: Connection states

61170

The following status diagram shows the influence of the services "start", "stop" and "reset" on the status of an MQTT connection:

After the initialisation in the "init" state has been completed, the connection automatically changes to the "running" state.

The connection automatically switches to the "error" state if at least one of the following events occurs:

- no MQTT broker available

## Example: Configuring the MQTT command channel

**Task:** Configuring and activating the MQTT command channel (IP address MQTT broker: 192.168.82.100, port: 1883, topic: abc).

**Solution:**

- ▶ Check whether MQTT broker can be reached and the port has been released.

- ▶ Activate command channel

- Request:

```
{
 "code": "request",
 "cid": 4711,
 "adr": "/connections/mqttConnection/MQTTSetup/mqttCmdChannel/status/start"
}
```

- ▶ Set the IP address of the MQTT broker/server.
- Request:

```
{
 "code": "request",
 "cid": 4712,
 "adr": "/connections/mqttConnection/mqttCmdChannel/mqttCmdChannelSetup/brokerIP/set
 data"
 "data": {"192.168.82.100"}
}
```

- ▶ Set the port number of the MQTT broker/server.
- Request:

```
{
 "code": "request",
 "cid": 4713,
 "adr": "/connections/mqttConnection/mqttCmdChannel/mqttCmdChannelSetup/brokerPort/s
 etdata"
 "data": {"1883"}
}
```

- ▶ Set topic.
- Request:

```
{
 "code": "request",
 "cid": 4714,
 "adr": "/connections/mqttConnection/mqttCmdChannel/mqttCmdChannelSetup/cmdTopic/set
 data"
 "data": {"abc"}
}
```

- ▶ Set standard response topic.
- Request:

```
{
 "code": "request",
 "cid": 4715,
 "adr": "/connections/mqttConnection/mqttCmdChannel/mqttCmdChannelSetup/defaultReply
 Topic/setdata"
 "data": {"xyz"}
}
```

- ▶ Set the QoS.
- Request:

```
{
 "code": "request",
 "cid": 4716,
 "adr": "/connections/mqttConnection/MQTTSetup/QoS/setdata",
 "data": {"QoS2": }
}
```

## Example: Publish the temperature to an MQTT broker

54687

**Task:** Publish the temperature of the IO-Link master to an MQTT broker (IP address MQTT broker: 192.168.82.100, port: 1883, topic: abc

### Solution:

- Request:

```
{
 "code": "request",
 "cid": -1,
 "adr": "/timer[1]/counter/datachanged/subscribe",
 "data": {
 "callback": "mqtt://192.168.82.100:1883/abc",
 "datatosend": ["processdatamaster/temperature"]
 }
```

- Response:

```
{
 "cid": -1,
 "code": 200
}
```

## 9.2.27 Using the IoT-Core Visualizer

61173

The ifm-IoT Core Visualizer of the IO-Link master provides a graphical user interface for accessing functions of the ifm-IoT Core.

To start the IoT Core Visualizer:

- Start web browser.
- Call the following address: <http://ipaddress/web/subscribe>
- > Browser shows IoT Core Visualizer:

The navigation menu gives the user access to the following functions:

- [Notification]: Creating and managing notifications (subscribe / unsubscribe)
- [Elements]: Searching for elements in device description
- [Parameter]: Configuring IO-Link master
- [Processdata]: Reading and writing process data
- [Update]: Updating the firmware of the IO-Link master

## Managing notifications

The menu page allows you to perform the following functions

- Creating notifications
- Showing active notifications
- Deleting notifications (single, all)

Requirements:

- IoT-Core Visualizer has been started.
- Click on [Notification].
- > The menu page for managing notifications appears.
- > The menu page shows all registered notifications in a table

## Creating a new notification

A wizard is used to register new notifications.

Requirements:

- The [Notification] menu page is open.
- Click on [+] on the right side of the table.
- > The wizard for the creation of notifications appears.

00-02-01-05-50-8b - online

Notification | Elements | Parameter | Processdata | Update |

Add Subscription

1 Events      2 Data      3 Transfer Info

**Event**

Please choose one event, you want to subscribe to.

Search for ... identifier of data element to subscribe to its changes

counter  
 00-02-01-05-50-8b/timer[1]/counter/datachanged

counter  
 00-02-01-05-50-8b/timer[2]/counter/datachanged

preset  
 00-02-01-05-50-8b/connections/mqttconnection/status/preset/datachanged

status  
 00-02-01-05-50-8b/connections/mqttconnection/status/datachanged

qos  
 00-02-01-05-50-8b/connections/mqttconnection/mqttsession/qos/datachanged

preset  
 00-02-01-05-50-8b/connections/mqttconnection/mqtcmdchannel/status/preset/datachanged

CANCEL      NEXT >

- ▶ Use the wizard to enter the required notification parameters step by step.
- > Created notification subscription is displayed in the table.

For cyclical notifications via timer[1] or timer[2], the user also needs to set the interval time of the timer in question.

## Deleting a notification

61176

Requirements:

- The [Notification] menu page is open.
- At least one notification is active.
- ▶ Click on [x] in the column [Unsubscribe].
- > The selected notification will be deleted (unsubscribe).

## Searching for elements in the device tree

The [Elements] menu page allows you to search the device description for elements with specific properties (status, profile, name) and to output the results.

Requirements:

- IoT-Core Visualizer has been started.
- Click on [Elements].
- > The input mask appears.

The screenshot shows the 'Elements' tab selected in the top navigation bar. Below it is a search interface with three input fields: 'identifier', 'profile', and 'type'. A search button labeled 'Search for ...' is positioned above the results. The results table lists three elements under the heading '00-02-01-05-50-8b'. Each row contains the element name, its URL, and its type and profiles information. There are 'Copy URL' links for each row.

| getidentity | 00-02-01-05-50-8b/getidentity | type: service<br>profiles: undefined | <a href="#">Copy URL</a> |
|-------------|-------------------------------|--------------------------------------|--------------------------|
| gettree     | 00-02-01-05-50-8b/gettree     | type: service<br>profiles: undefined | <a href="#">Copy URL</a> |
| querytree   | 00-02-01-05-50-8b/querytree   | type: service<br>profiles: undefined | <a href="#">Copy URL</a> |

- Enter the search criteria of the required item in the [identifier], [profile] and [type] boxes.
- Click on [Search for ...].
- > IoT-Core Visualizer searches device description for elements with selected search criteria.
- > The result list shows all elements found.

## Configuring IO-Link the master

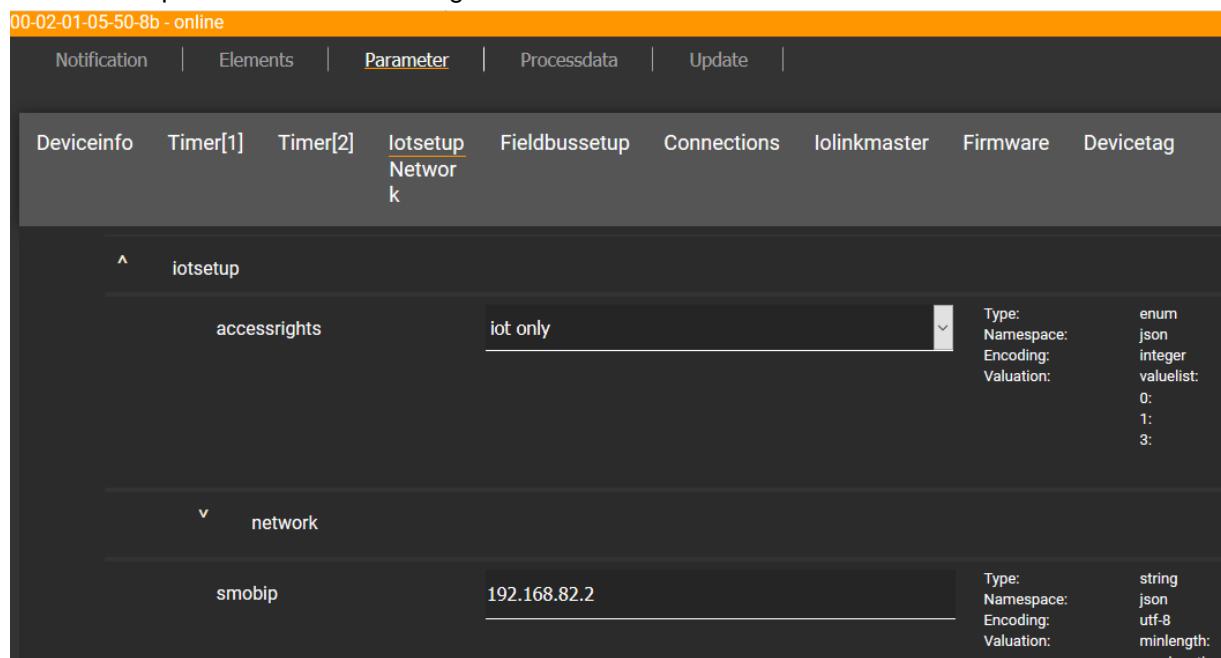

The [Parameter] menu page allows you to configure the IO-Link master.

Available options:

- Reading and writing individual parameters
- Backup and restore the current configuration of the machine.

Requirements:

- IoT-Core Visualizer has been started.
- Click on [Parameter].
- > The menu page shows the available parameters of the IO-Link master.
- > Current parameter values are displayed.
- > Editable parameters can be changed.

To change a parameter:

- Navigate to the desired parameter in the device description.
- Changing the parameter value
- Click on the pencil icon to save the change on the IO-Link master.
- > The changed parameter value is active.
- Optional: Repeat the procedure to change further parameter values.

## Reading and writing process data

The menu page allows the process data of the IO-Link master and the connected IO-Link devices to be read and written.

### Requirements:

- IoT-Core Visualizer has been started.
- Click on [Processdata].
- > Menu page shows the substructures of the device description that contain process data and events.
- > The current process values are displayed.
- > Editable process data can be changed.

| Type   | Namespace | Encoding  |  |
|--------|-----------|-----------|--|
| string | json      | hexstring |  |

| Type   | Namespace | Encoding | Valuation | min:  | max: |
|--------|-----------|----------|-----------|-------|------|
| number | json      | integer  | 0         | 65535 |      |

To change the value of a process date:

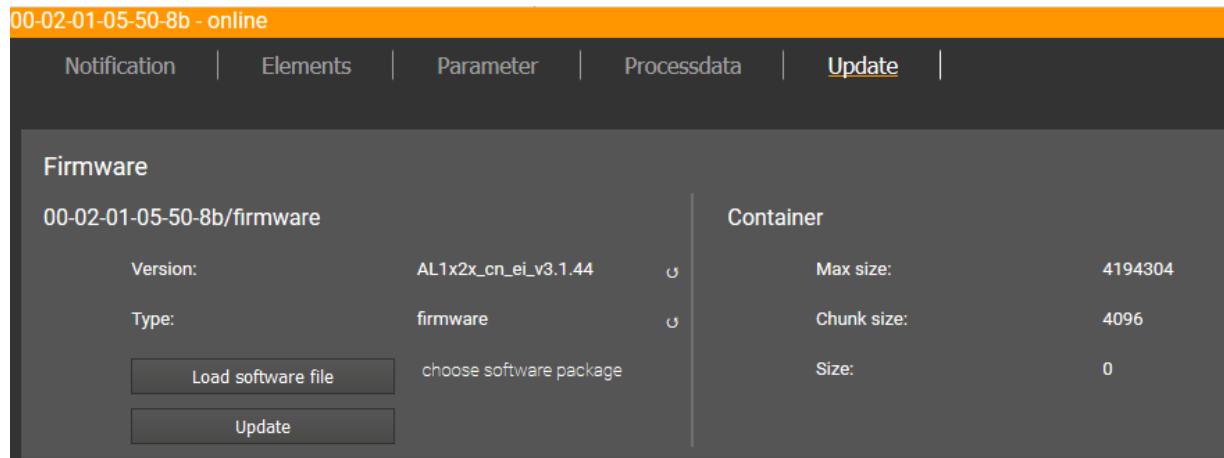

- Navigate to the required process date in the device description.
- Change the process value.
- Click on the pencil icon to save the change on the IO-Link master.
- > The changed process value is active.
- Optional: Repeat the procedure to change further process values.

## Updating the firmware

The [Update] menu page allows you to update the firmware of the IO-Link master:

Requirements:

- IoT-Core Visualizer has been started.
- Click on [Update].
- > Menu page displays information about the current firmware version.

- Click on [Load software file] and select a new firmware file (\*.bin).
- Click on [Update] to start the update process.
- > The firmware of the IO-Link master will be updated.
- > The area shows the progress bar.
- > If the update process has been successful, the IO-Link master will restart automatically.

## 9.3 EtherNet/IP

34391

On the fieldbus side, the device can be configured with any EtherNet/IP compatible projection software.

The information in the following sections refers to the EtherNet/IP projection software RSLogix 5000.

### 9.3.1 Registration of the EDS file

34324

ifm provides an EDS file to integrate the AL1320 in a EtherNet/IP projection software. The user can download the EDS file from the ifm website (→ [www.ifm.com](http://www.ifm.com)). In the EDS file, all parameters, process data, and their valid value ranges are defined.

To add the AL1320 to the device catalogue of RSLogix5000:

- ▶ Download the EDS file of the AL1320 from the ifm website.
- ▶ Start RSLogix5000.
- ▶ Select [Tools] > [EDS Hardware Installation Tool].
- > EDS Wizard appears.
- ▶ Register the downloaded EDS file of the AL1320 with the EDS Wizard.
- > EDS Wizard installs the EDS file and adds the AL1320 to the device catalogue.

### 9.3.2 Integrate the IO-Link Master into the EtherNet/IP project

34392

The AL1320 is integrated as module of an I/O scanner in the EtherNet/IP project.

#### Requirements:

- > The EDS file of the AL1320 is installed (→ **Registration of the EDS file** (→ p. 81)).

#### 1 Create/open EtherNet/IP project

- ▶ Start RSLogix 5000.
- ▶ Create new EtherNet/IP project.  
OR  
Open an existing EtherNet/IP project.

#### 2 Configure EtherNet/IP PLC and IO scanner

- ▶ Select and configure EtherNet/IP controller and IO scanner.
- > EtherNet/IP project includes a EtherNet/IP controller and an IO scanner.

#### 3 Integrate AL1320 in project

- ▶ In the Controller Organizer: Right mouse click on the IO scanner.
- > Context menu appears.
- ▶ In the context menu: Select [New Module...].
- > The window [Select Module Type] appears.

- ▶ Select AL1320 and click on [Create].
- > The [New Module] window appears.
- ▶ Enter name and IP address of the AL1320.
- ▶ Click on [OK] to adopt the entered values.
- > RSLogix 5000 adds AL1320 as sub-element of the IO scanner to the project.

#### 4 Save the project

- ▶ Save EtherNet/IP project

### 9.3.3 Set connection types and RPI

34407

The IO-Link master supports different connection types (→ **Supported connection types** (→ p. [99](#))). The user can choose which object instances of the input assembly and the output assembly are used. This makes it possible to adapt the size of the transmitted and received data. Additionally the Request Package Interval (RPI) can be selected.

To set the connection type:

**Requirements:**

- > AL1320 is correctly integrated into the EtherNet/IP project (→ **Integrate the IO-Link Master into the EtherNet/IP project** (→ p. [81](#), "Example: Reading properties of an element" → p. [43](#))).

#### 1 Open the module properties

- ▶ In the Controller Organizer: Double-click on the IO-Link master node
- > Dialogue window appears.

#### 2 Set connection type

- ▶ Click on [Change...].
- > The [Module Definition] dialogue window appears.
- ▶ Select the required connection type from the list [Connections].
- ▶ Click on [OK] to apply the changes.

#### 3 Change RPI

- ▶ Click on [Connection] tab.
- > The connection settings appear.
- ▶ Select required time value from [RPI] list.
- ▶ Click on [OK] to apply the changes.

## 9.3.4 Configure AL1320

The AL1320 is configured via the controller tags.

### Requirements:

- > AL1320 is correctly integrated in the EtherNet/IP project (→ **Integrate the IO-Link Master into the EtherNet/IP project** (→ p. 81, "Example: Reading properties of an element" → p. 43)).

### 1 Open controller tags

- In the Controller Organizer: Double click on [Controller Name\_of\_Project] > [Controller Tags]
- > [Controller Tags] window appears.
- In the tree view: Click on [AL1320:C].
- > Controller tags for the configuration of the device appear.

### 2 Configure AL1320

- Set the following controller tags as required:

| Name                              | Description                                                                                                                                  | Possible values |                                                                                                                                                                                                                                                                                                                                     |
|-----------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------|-----------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| [AL1320:C.Communication_Profile]  | The access rights to the parameter data, process data and events/diagnostic messages of the IO-Link master and the connected IO-Link devices | 0x00            | EtherNet/IP + LineRecorder <ul style="list-style-type: none"> <li>▪ EtherNet/IP and LR DEVICE have read and write access rights to parameters and process data</li> <li>▪ EtherNet/IP and LR DEVICE have read access rights to events/alarms</li> </ul>                                                                             |
|                                   |                                                                                                                                              | 0x01            | EtherNet/IP + LineRecorder (ro) <ul style="list-style-type: none"> <li>▪ EtherNet/IP has read and write access rights to parameters and process data</li> <li>▪ EtherNet/IP has read access rights to events/alarms</li> <li>▪ LR DEVICE only has read access rights to parameters, process data and events/alarms</li> </ul>       |
|                                   |                                                                                                                                              | 0x02            | EtherNet/IP only <ul style="list-style-type: none"> <li>▪ EtherNet/IP has read and write access rights to parameters and process data</li> <li>▪ EtherNet/IP has read access rights to events/alarms</li> <li>▪ LR DEVICE has no access rights (parameters, process data, events/alarms, web interface, firmware update)</li> </ul> |
|                                   |                                                                                                                                              | 0x03            | Continue in Use Case<br>previous setting is valid                                                                                                                                                                                                                                                                                   |
|                                   |                                                                                                                                              |                 |                                                                                                                                                                                                                                                                                                                                     |

|                                   |                                                                                                                                              | 0x03            | 16 bytes input, 16 bytes output                                                                                                                                                                                                                                                                                                     |
|                                   |                                                                                                                                              | 0x04            | 32 bytes input, 32 bytes output                                                                                                                                                                                                                                                                                                     |

- Save EtherNet/IP project

### 9.3.5 Configure IO-Link ports

The IO-Link ports are configured via the controller tags. The user can configure each IO-Link port separately.

To configure the IO-Link ports:

**Requirements:**

- > AL1320 is correctly integrated in the EtherNet/IP project (→ **Integrate the IO-Link Master into the EtherNet/IP project** (→ p. 81, "Example: Reading properties of an element" → p. 43)).

**1 Open controller tags**

- In the Controller Organizer: Double click on [Controller Name\_of\_Project] > [Controller Tags]
- > [Controller Tags] window appears.
- In the tree view: Click on [AL1320:C].
- > Controller tags for the configuration of the device appear.

**2 Configure IO-Link ports**

- Configure the following tags for each IO-Link port at will:

| Name                                      | Description                                                                                                                         | Possible values                          |                                                               |
|-------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------|---------------------------------------------------------------|
| [AL1320:C.Port_Mode_Port_x]               | Operating mode of the IO-Link port                                                                                                  | 0x00                                     | Interface deactivated                                         |
|                                           |                                                                                                                                     | 0x01                                     | Operation as digital input (DI)                               |

x = 1...4

- ▶ Save EtherNet/IP project.

### 9.3.6 Configure IO-Link devices

34359

The AL1320 supports the configuration of the connected IO-Link devices from the EtherNet/IP projection software. For this, ifm offers the EtherNet/IP object "IO-Link Request" (→ **IO-Link requests (object class: 0x80)** (→ p. 134)). The object enables direct read and write access to IO-Link objects of the IO-Link device (Indexed Service Data Unit (ISDU)). The extent of the configurable parameters depends on the IO-Link device.

The following services are available:

| Name          | Description                               | Reference                      |
|---------------|-------------------------------------------|--------------------------------|
| Read request  | Send a request to read an IO-Link object  | → <b>Read_ISDU</b> (→ p. 134)  |
| Write request | Send a request to write an IO-Link object | → <b>Write_ISDU</b> (→ p. 138) |

Information for the execution of acyclic commands: → **Use acyclic services** (→ p. 88)

Available parameters of the IO-Link devices: → Operating instructions of the IO-Link device

### 9.3.7 Read process data

The user can access the cyclic input data of the connected sensors and IO-Link devices via the controller tags of the AL1320.

 To check the validity of the cyclic process data, evaluate the PQI byte (→ **Mapping: PQI** (→ p. [107](#))).

Even if the fieldbus connection is interrupted, the PQI byte indicates that the process data is valid. This may have an unintended impact on the control process.

- ▶ Take suitable measures to detect an interruption of the fieldbus connection.

To access the input data:

- ▶ Start RSLogix5000.
- ▶ Open a EtherNet/IP project.
- ▶ In the project tree: Mouse click on [Controller Tags] > [AL1320.I]
- > The window shows the data structure with cyclic input data ([AL1320.I:Data]).
- ▶ Link process data to variables.

 The mapping of the process data to the data structure [AL1320.I:Data] depends on the configured instance of the input assembly object (→ **Cyclic data** (→ p. [103](#))).

### 9.3.8 Write process data

The user can access the cyclic output data of the connected actuators and IO-Link devices via the controller tags of the AL1320.

 To check the validity of the cyclic process data, evaluate the PQI byte (→ **Mapping: PQI** (→ p. [107](#))).

Even if the fieldbus connection is interrupted, the PQI byte indicates that the process data is valid. This may have an unintended impact on the control process.

- ▶ Take suitable measures to detect an interruption of the fieldbus connection.

To access the cyclic output data:

- ▶ start RSLogix5000.
- ▶ Open a EtherNet/IP project.
- ▶ In the project tree: Mouse click on [Controller Tags] > [AL1320.O]
- > The window shows the data structure with cyclic output data ([AL1320.O:Data]).
- ▶ Link process data to variables.

 The mapping of the process data to the data structure [AL1320.O:Data] depends on the configured instance of the input assembly object (→ **Cyclic data** (→ p. [103](#))).

### 9.3.9 Read diagnostic information and events

Diagnostic and status information is a part of the cyclically transmitted process data. The input assembly includes the following information:

| Byte | Content                                                             |
|------|---------------------------------------------------------------------|
| 2    | Indication of short circuit/overload of the IO-Link ports X01...X04 |
| 3    | Status indication of the voltage supply of the device               |
| 43   | Port X01: Status information + events                               |
| 58   | Port X02: Status information + events                               |
| 73   | Port X03: Status information + events                               |
| 88   | Port X04: Status information + events                               |

To access the cyclically transmitted diagnostic and status information:

- ▶ Starting RSLogix5000.
- ▶ Open a EtherNet/IP project.
- ▶ In the project tree: Mouse click on [Controller Tags] > [AL1320.I]
- > The window shows cyclic input data (Input Assembly).
- ▶ Link diagnostic and status information with variables.

Mapping of the diagnostic and status information on the data structure [AL1320.C:I]: → **Cyclic data** (→ p. [103](#)).

### 9.3.10 EtherNet/IP: Programmers' notes

The programmer can access on the following data from the PLC application:

- Read device information of the AL1320
- Read diagnostics and alarms
- Set parameters of the connected IO-Link devices

The following sections show the available options.

Further information about the functional/operational blocks: → Help function of the EtherNet/IP projection software

34383

## Supported configuration modes

The AL1320 supports the following EtherNet/IP configuration modes:

- **Top down**
  - Configuration of the EtherNet/IP slave with the EtherNet/IP projection software (Configuration Assembly)
  - EtherNet/IP plc transmits the created configuration to the EtherNet/IP slave, where it is stored
- **Independent**
  - Configuration of the EtherNet/IP slave with LR DEVICE oder IoT core
  - Configuration Assembly in EtherNet/IP project is not evaluated

## Use acyclic services

34381

The AL1320 offers the following options to execute acyclic commands:

### Command channels in cyclic process data

34318

Within the cyclic input and output data, special areas are available for the acyclic data transmission. Both read and write access can be implemented via the areas.

### Principle of the command channels

34343

General process of an acyclic communication:

- 1 **Write command request**
  - ▶ In the request channel: write requested command data (without [Trigger] bit)
  - ▶ Set [Trigger] = 1.
  - > Change of [Trigger] = 1 indicates a new command.
  - > In the response channel: all bytes are set to 0.
  - > Command processing is started.
- 2 **Check status**
  - ▶ In the response channel: check [Handshake] bit.
    - If [Handshake] <> 0: command processing completed, continue with step 3.
    - If [Handshake] == 0: command is processed, repeat step 2.
- 3 **Read command response**
  - ▶ In the response channel: read responded user data.
  - ▶ In the request channel: set [Trigger] = 0.

## Acyclic port commands

For the acyclic access to the configuration of the IO-Link ports of the AL1320, the following commands are available:

| Command                          | Description                                                                                                                            | Reference                                                                            |
|----------------------------------|----------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------|
| Set mode                         | Set the operating type of the IO-Link port                                                                                             | → <b>Command 0x10 – Set mode</b> (→ p. <a href="#">118</a> )                         |
| Set Validation ID / Data Storage | Adjust the supported IO-Link standard and the behaviour of the IO-Link master when connecting a new IO-Link device to the IO-Link port | → <b>Command 0x20 – Set validation ID / data storage</b> (→ p. <a href="#">120</a> ) |
| Set fail-safe data pattern       | Behaviour of the outputs when the EtherNet/IP connection is interrupted and setting of the corresponding fail-safe values              | → <b>Command 0x30 – Set fail-safe data pattern</b> (→ p. <a href="#">122</a> )       |

The port commands use the same mechanisms as the acyclic command channel (→ **Acyclic command channel** (→ p. [112](#))).

## EtherNet/IP mechanisms for acyclic commands

Acyclic commands can be executed with the EtherNet/IP command Message (MSG).

Parameters of the available field bus objects: → **Field bus objects** (→ p. [124](#))

For detailed information about the Message (MSG) command: → Operating instructions RSLogix 5000

## 10 Operation

### Content

|                                 |       |
|---------------------------------|-------|
| Using web-based management..... | 90    |
|                                 | 34061 |

### 10.1 Using web-based management

61181

The device has an integrated web server. The web server generates a website with the following data:

- Status information of the ports
- Access to product page of connected IO-Link devices (only ifm devices)
- Diagnostic information of the device
- Version information of the installed firmware components

To access the web interface of the IO-Link master:

- ▶ Connect the IO-Link master to the laptop / PC via the IoT port.
  - ▶ Optional: Check the IP settings of the IoT interface.
  - ▶ Start web browser.
  - ▶ In the address field of the web browser, enter the IP address of the IoT interface and confirm with [ENTER].
- > The web browser shows the website with the status and diagnostic information of the device.

# 11 Maintenance, repair and disposal

## Content

|                               |    |
|-------------------------------|----|
| Cleaning process.....         | 91 |
| Updating the firmware .....   | 91 |
| Replacing IO-Link device..... | 91 |

51990

The operation of the unit is maintenance-free.

- Dispose of the unit in an environmentally friendly way in accordance with the applicable national regulations when it is no longer used.

## 11.1 Cleaning process

51991

- Clean the surface of the unit when necessary.
- Do not use any caustic cleaning agents for this!
- In case of severe soiling, use a damp cloth.
- Do not use any caustic cleaning agents for this!

## 11.2 Updating the firmware

61183

The firmware of the IO-Link master can be updated via the IoT Core Visualizer → **Updating the firmware** (→ p. [80](#)).

## 11.3 Replacing IO-Link device

34182

To replace an IO-Link device:

### Requirement:

- > New IO-Link device is with factory settings.
- > New IO-Link device supports IO-Link standard 1.1 or higher.

### 1 Set data storage

- Set the following parameters of the IO-Link port
  - Set Validation and Data Storage to [Type compatible V1.1 device with Restore] or [Type compatible V1.1. device with Backup + Restore]
  - Set correct values to [Vendor ID] and [Device ID] according to properties of the IO-Link device.
- Save changes.

### 2 Replace IO-Link device

- Disconnect old IO-Link device from IO-Link master.
- Connect new IO-Link device with the same IO-Link port of the AL1320.
- > IO-Link master copies parameter values from the data memory to the new IO-Link device.

## 12 Factory settings

In the factory settings, the device has the following parameter settings:

| Parameter                            | Factory setting |
|--------------------------------------|-----------------|
| [IP address] (EtherNet/IP)           | 192.168.1.250   |
| [Subnet mask] (EtherNet/IP)          | 255.255.255.0   |
| [IP gateway address] (EtherNet/IP)   | 0.0.0.0         |
| [IP address] (IoT interface)         | 169.254.X.X     |
| [Subnet mask] (IoT interface)        | 255.255.0.0     |
| [IP gateway address] (IoT interface) | 0.0.0.0         |
| [EtherNet/IP name]                   | blank           |
| Data memory (Data Storage)           | empty           |

### 14.1.2 Electrical data

33808

| Electrical data             |                                |
|-----------------------------|--------------------------------|
| Operating voltage [V]       | 20...30 DC; (US; to SELV/PELV) |
| Current Consumption [mA]    | 300...3900; (US)               |
| Protection class            | III                            |
| Sensor supply US            |                                |
| Max. current load total [A] | 3.6                            |

### 14.1.3 Inputs / outputs

34068

| Inputs / outputs                   |                                                           |
|------------------------------------|-----------------------------------------------------------|
| Total number of inputs and outputs | 8; (configurable)                                         |
| Number of Inputs and Outputs       | Number of digital inputs: 8; Number of digital outputs: 4 |

### 14.1.4 Inputs

34069

| Inputs                   |                                  |
|--------------------------|----------------------------------|
| Number of digital inputs | 8; (IO-Link Port Class A: 4 x 2) |
| Switching level high [V] | 11...30                          |
| Switching level low [V]  | 0...5                            |

|                                                 |     |
|-------------------------------------------------|-----|
| Digital inputs protected against short circuits | yes |
|-------------------------------------------------|-----|

## 14.1.5 Outputs

34053

| Outputs                           |                                  |
|-----------------------------------|----------------------------------|
| Number of digital outputs         | 4; (IO-Link Port Class A: 4 x 1) |
| Max. current load per output [mA] | 300                              |
| Short-circuit protection          | yes                              |

## 14.1.6 Interfaces

34389

| Interfaces                 |                                                                                                                                                                                                   |
|----------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Communication interface    | Ethernet; IO-Link                                                                                                                                                                                 |
| Communication interface    | IO-Link; TCP/IP; EtherNet/IP                                                                                                                                                                      |
| <b>Ethernet</b>            |                                                                                                                                                                                                   |
| Transmission standard      | 10Base-T; 100Base-TX                                                                                                                                                                              |
| Transmission rate [MBit/s] | 10; 100                                                                                                                                                                                           |
| Protocol                   | TCP/IP; EtherNet/IP                                                                                                                                                                               |
| Factory settings           | <ul style="list-style-type: none"> <li>▪ IP address: 192.168.1.250</li> <li>▪ Subnet mask: 255.255.255.0</li> <li>▪ Gateway IP address: 0.0.0.0</li> <li>▪ MAC address: see type label</li> </ul> |
| <b>IO-Link master</b>      |                                                                                                                                                                                                   |
| Type of transmission       | COM 1 / COM 2 / COM 3                                                                                                                                                                             |
| IO-Link revision           | V1.1                                                                                                                                                                                              |
| Number of ports Class A    | 4                                                                                                                                                                                                 |
| <b>IoT interface</b>       |                                                                                                                                                                                                   |
| Transmission standard      | 10Base-T; 100Base-TX                                                                                                                                                                              |

|                                             | 34170 |

### Configuration Assembly (Instance 199)

34363

 The values of the Configuration Assembly are set in RSLogix 5000 via the controller tags of the EtherNet/IP project.

## Command 0x10 – Set mode

The command changes the operating mode of an IO-Link port of the AL1320.

Corresponding parameter: [Port Mode] (→ **Mapping: Port configuration** (→ p. 101))

## Command 0x30 – Set fail-safe data pattern

The command sets the behaviour of the outputs when the EtherNet/IP connection and the corresponding fail-safe values are interrupted.

Corresponding parameter: [Fail-safe Mode] (→ **Mapping: Port configuration** (→ p. [101](#))  
 The number of the required fail-safe values results from the size of the output data  
 (→ **Configuration Assembly (Instance 199)** (→ p. [100](#))).

## CIP class services

34335

The device supports the following class and instance services:

| Class code |     | Service                | Description                                            |
|------------|-----|------------------------|--------------------------------------------------------|
| dec        | hex |                        |                                                        |
| 01         | 01  | Get Attribute All      | Read all attribute values of the class or instance     |
| 02         | 02  | Set Attribute All      | Change all attribute values of the class or instance   |
| 05         | 05  | Reset                  | Reset                                                  |
| 09         | 09  | Delete                 | Delete                                                 |
| 14         | 0E  | Get Attribute Single   | Read single attribute value of the class or instance   |
| 16         | 10  | Set Attribute Single   | Change single attribute value of the class or instance |
| 75         | 4B  | Read ISDU              | Read ISDU                                              |
| 76         | 4C  | Write ISDU             | Write ISDU                                             |
| 77         | 4D  | Write Failsafe Pattern | Write failsafe pattern                                 |
| 78         | 4E  | Forward Close          | Close connection                                       |
| 84         | 54  | Forward Open           | Open new connection                                    |

## CIP object classes

The device supports the following CIP object classes:

| Class code |     | Object type               | Reference                                                                              |
|------------|-----|---------------------------|----------------------------------------------------------------------------------------|
| dec        | hex |                           |                                                                                        |
| 01         | 01  | Identity Object           | → <b>Identity Object (object class: 0x01)</b> (→ p. <a href="#">126</a> )              |
| 02         | 02  | Message Router Object     | → <b>Message Router Object (object class: 0x02)</b> (→ p. <a href="#">128</a> )        |
| 04         | 04  | Assembly Object           | → <b>Assembly Object (object class: 0x04)</b> (→ p. <a href="#">129</a> )              |
| 06         | 06  | Connection Manager Object | → <b>Connection Manager Object (object class: 0x06)</b><br>(→ p. <a href="#">131</a> ) |
| 71         | 47  | Device Level Ring Object  | → <b>Device Level Ring Object (object class: 0x47)</b> (→ p. <a href="#">132</a> )     |
| 72         | 48  | Quality of Service        | → <b>Quality of Service (object class: 0x48)</b> (→ p. <a href="#">133</a> )           |
| 128        | 80  | IO-Link Requests          | → <b>IO-Link requests (object class: 0x80)</b> (→ p. <a href="#">134</a> )             |

| 246        | F6  | Ethernet Link Object      | → <b>Ethernet Link Object (object class: 0xF6)</b> (→ p. <a href="#">146</a> )         |

## Identity Object (object class: 0x01)

34340

The Identity Object contains the general information about the device.

### Class attributes

34310

| Attr. ID | Access | Name                                     | Data type | Description                            | Value |
|----------|--------|------------------------------------------|-----------|----------------------------------------|-------|
| 1        | Get    | Revision                                 | UINT      | Revision of the object                 | 1     |
| 2        | Get    | Max instance                             | UINT      | Max. number of instances of the object | 1     |
| 6        | Get    | Maximum ID Number<br>Class Attributes    | UINT      | ID of the last class attribute         | 7     |
| 7        | Get    | Maximum ID Number<br>Instance Attributes | UINT      | ID of the last instance attribute      | 9     |

### Instance attributes

34339

| Attr. ID | Access | Name                            | Data type    | Description                                                           | Preset                        |
|----------|--------|---------------------------------|--------------|-----------------------------------------------------------------------|-------------------------------|
| 1        | Get    | Vendor ID                       | UINT         | Manufacturer ID                                                       | 322                           |
| 2        | Get    | Device type                     | UINT         | Type of unit                                                          | 12                            |
| 3        | Get    | Product code                    | UINT         | Identification of a particular product of a vendor                    | 1320                          |
| 4        | Get    | Revision                        | STRUCT       | Revision of the article that is represented by the Identity Object    | 1.1                           |
|          |        | ▪ Major revision                | USINT        | Main revision (1...127)                                               | 1                             |
|          |        | ▪ Minor revision                | USINT        | Side revision (3 digits, if necessary with zeros in the beginning)    | 1                             |
| 5        | Get    | Status                          | WORD         | Status of the device                                                  |                               |
| 6        | Get    | Serial number                   | UDINT        | Serial number of the device                                           |                               |
| 7        | Get    | Product Name                    | SHORT STRING | Readable device designation (max. 32 ASCII characters)                | IO-Link Master DL EIP 4P IP67 |
| 8        | Get    | State                           | USINT        | Current status of the device (according to status transition diagram) |                               |
|          |        |                                 |              | 0 Nonexistent                                                         |                               |
|          |        |                                 |              | 1 Device Self Testing                                                 |                               |
|          |        |                                 |              | 2 Standby                                                             |                               |
|          |        |                                 |              | 3 Operational                                                         |                               |
|          |        |                                 |              | 4 Major Recoverable Fault                                             |                               |

|          |        |                                 |              | 6...254 Reserved                                                      |                               |
|          |        |                                 |              | 255 Default for Get_Attributes_All service                            |                               |
| 9        | Get    | Configuration Consistency Value | UINT         | The content shows the configuration of the device                     | 0                             |

## Supported services

| Service code |     | Name                 | Class | Attribute | Description             |
|--------------|-----|----------------------|-------|-----------|-------------------------|
| dec          | hex |                      |       |           |                         |
| 01           | 01  | Get_Attribute_All    | yes   | yes       | Read all attributes     |
| 05           | 05  | Reset                | yes   | yes       | Reset                   |
| 14           | 0E  | Get_Attribute_Single | yes   | yes       | Read single attribute   |
| 16           | 10  | Set_Attribute_Single | yes   | yes       | Change single attribute |

If an Identity Object receives a reset request, it carries out the following actions:

- It checks if it supports the requested reset type.
- It responds to the request.
- It tries to execute the requested reset type.

Supported reset types:

- 0 Reboot the device (obligatory for all EtherNet/IP devices).
- 1 Restore factory settings and reboot the device.

## Message Router Object (object class: 0x02)

34390

The Message Router Object provides an access with which an EtherNet/IP client can address a service to any object class or instance in the physical device.

### Class attributes

34320

| Attr. ID | Access | Name                                     | Data type | Description                            | Value |
|----------|--------|------------------------------------------|-----------|----------------------------------------|-------|
| 1        | Get    | Revision                                 | UINT      | Revision of the object                 | 1     |
| 2        | Get    | Max instance                             | UINT      | Max. number of instances of the object | 1     |
| 3        | Get    | Number of Instances                      | UINT      | Number of instances                    | 1     |
| 6        | Get    | Maximum ID Number<br>Class Attributes    | UINT      | ID of the last class attribute         | 7     |
| 7        | Get    | Maximum ID Number<br>Instance Attributes | UINT      | ID of the last instance attribute      | 0     |

### Instance attributes

34402

The object has no instance attributes.

### Supported services

34374

| Service code |     | Name                 | Class | Attribute | Description                 |
|--------------|-----|----------------------|-------|-----------|-----------------------------|
| dec          | hex |                      |       |           |                             |
| 14           | 0E  | Get_Attribute_Single | yes   | no        | Read single attribute value |

## Assembly Object (object class: 0x04)

34332

The Assembly Object combines attributes of several objects to allow data to be sent to or received from each object via one connection.

### Class attributes

34309

| Attr. ID | Access | Name                                  | Data type | Description                            | Value  |
|----------|--------|---------------------------------------|-----------|----------------------------------------|--------|
| 1        | Get    | Revision                              | UINT      | Revision of the object                 | 2      |
| 2        | Get    | Max instance                          | UINT      | Max. number of instances of the object | 0x00C7 |
| 3        | Get    | Number of Instances                   | UINT      | Number of instances                    | 3      |
| 6        | Get    | Maximum ID Number Class Attributes    | UINT      | ID of the last class attribute         | 7      |
| 7        | Get    | Maximum ID Number Instance Attributes | UINT      | ID of the last instance attribute      | 4      |

### Instances

34403

| Attr. ID | Access   | Name                   | Data type | Description                                                                                                                      |

## Connection Manager Object (object class: 0x06)

34367

The Connection Manager Object structures and manages the internal resources that are used for the connection.

### Class attributes

34319

| Attr ID | Access | Name                                     | Data type | Description                            | Value |
|---------|--------|------------------------------------------|-----------|----------------------------------------|-------|
| 1       | Get    | Revision                                 | UINT      | Revision of the object                 | 1     |
| 2       | Get    | Max instance                             | UINT      | Max. number of instances of the object | 1     |

## Quality of Service (object class: 0x48)

34371

Quality of Service (QoS) enables prioritising of Ethernet frames. The priorities of the Ethernet frames can be influenced with the attributes "Differentiate Service Code Points" (DSCP) or "802.1Q Tag".

### Class attributes

34307

| Attr ID | Access | Name                                  | Data type | Description                            | Value |
|---------|--------|---------------------------------------|-----------|----------------------------------------|-------|

### Supported services

34406

| Service code |     | Name                 | Class | Attribute | Description                 |
|--------------|-----|----------------------|-------|-----------|-----------------------------|
| dec          | hex |                      |       |           |                             |
| 01           | 01  | Get_Attribute_All    | yes   | yes       | Read all attribute values   |
| 14           | 0E  | Get_Attribute_Single | no    | yes       | Read single attribute value |

34412

The manufacturer-specific object "IO-Link Requests" enables read and write access to the IO-Link objects of an IO-Link device connected to a AL1320 via ISDU (Index Service Data Unit). The object projects the mechanisms of the CIP addressing on the IO-Link protocol.

## Class attributes

34308

| Attr ID | Access | Name                                  | Data type | Description                            | Value |
|---------|--------|---------------------------------------|-----------|----------------------------------------|-------|
| 1       | Get    | Revision                              | UINT      | Revision of the object                 | 4     |
| 2       | Get    | Max instance                          | UINT      | Max. number of instances of the object | 2     |
| 6       | Get    | Maximum ID Number<br>Class Attributes | UINT      | Number of instances of the object      | 8     |

## Instance attributes

34399

The required IO-Link port of the device is addressed via the instance attribute.

## Supported services

34378

| Service code |     | Name                                                           | Class | Attribute | Description                           |
|--------------|-----|----------------------------------------------------------------|-------|-----------|---------------------------------------|
| dec          | hex |                                                                |       |           |                                       |

| 76           | 4C  | → <b>Write_ISDU</b> (→ p. <a href="#">138</a> )                | no    | yes       | Read ISDU                             |
| 77           | 4D  | → <b>Write Failsafe Pattern</b><br>(→ p. <a href="#">141</a> ) | no    | yes       | Write failsafe values of IO-Link port |

## Read\_ISDU

34323

With Read\_ISDU, parameters of a connected IO-Link device can be read.

## Request

34337

CIP Attribute determines the IO-Link port to which the IO-Link device is connected. The area CIP User Specific Service Data contains the IO-Link index and the IO-Link sub-index of the IO-Link object whose value is to be read:

| CIP format                     | Data type | MSG Config      | IO-Link mapping               |
|--------------------------------|-----------|-----------------|-------------------------------|
| CIP Class ID                   | UINT      | 0x80            | IO-Link acyclic access        |
| CIP Instance ID                | UINT      | 0x01            | IO-Link master                |
| CIP Attributes                 | USINT     | 0x01...0x04     | Port number                   |
| CIP Service code ID            | USINT     | 0x4B            | Request "Read_ISDU"           |
| CIP User specific service data | UINT      | 0x0000...0xFFFF | IO-Link ISDU object index     |
|                                | USINT     | 0x00...0xFF     | IO-Link ISDU object sub-index |

## Response

- Positive response

If the service has been executed successfully (CIP Error Code = 0), the read data are returned bit by bit (CIP User Specific Service Data). The answer has the following format:

| CIP format                     | Data type | MSG Config  | IO-Link mapping        |
|--------------------------------|-----------|-------------|------------------------|
| CIP Class ID                   | UINT      | 0x80        | IO-Link acyclic access |
| CIP Instance ID                | UINT      | 0x01        | IO-Link master         |
| CIP Attributes                 | USINT     | 0x01...0x04 | Port number            |
| CIP Service Code ID            | USINT     | 0x4C        | Response "Read_ISDU"   |
| CIP Error Code                 | USINT     | 0x00        | --                     |
| CIP Extended Error Code        | USINT     | 0x00        | --                     |
| CIP User Specific Service Data | USINT     | 0x00...0xFF | Data (byte 0)          |
|                                | USINT     | 0x00...0xFF | Data (byte 1)          |
|                                | ...       | ...         | ...                    |
|                                | USINT     | 0x00...0xFF | Data (byte n)          |

The read data is in the IO-Link format. If necessary, the user needs to adapt the byte arrangement of the read data to the CIP format.

- Negative response**

If an error occurs while executing the service (CIP Error Code  $\neq 0$ ), an extended error code is transmitted. If the CIP Error Code = 0x1E, then the CIP Extended Error Code = 0x00 and the CIP User Specific Service Data area contains the IO-Link Error Code as well as IO-Link Additional Code. The answer has the following format:

| CIP format                     | Data type | MSG Config  | IO-Link mapping                                                                                                      |
|--------------------------------|-----------|-------------|----------------------------------------------------------------------------------------------------------------------|
| CIP Class ID                   | UINT      | 0x80        | IO-Link acyclic access                                                                                               |
| CIP Instance ID                | UINT      | 0x01        | IO-Link master                                                                                                       |
| CIP Attributes                 | USINT     | 0x01...0x04 | Port number                                                                                                          |

| 0x1E | Embedded service, error: Error occurred during an IO-Link service. Byte 0 and byte 1 of the User Specific Service Data contain the IO-Link error code and an additional code that are returned by the IO-Link master. |

**Example: reading the parameter value of anIO-Link device**

**Task:** reading the value of the parameter X of an IO-Link device

- IO-Link device at the port: 0x02
- Parameter X in the object directory of an IO-Link device: Index: 90, sub-index 3

From this, the following results for the configuration of the EtherNet/IP command Message (MSG):

| CIP format                     | Data type | MSG Config | Description                   |
|--------------------------------|-----------|------------|-------------------------------|
| CIP Class ID                   | UINT      | 0x80       | IO-Link acyclic access        |
| CIP Instance ID                | UINT      | 0x01       | IO-Link master                |
| CIP Attributes                 | USINT     | 0x02       | Port number                   |
| CIP Service Code ID            | USINT     | 0x4B       | Request "ISDU_Read"           |
| CIP User Specific Service Data | UINT      | 0x005A     | IO-Link ISDU object index     |
|                                | USINT     | 0x03       | IO-Link ISDU object sub-index |

After successful execution of the request, the response area has the following content:

| CIP format                     | Data type | MSG Config | Description                                 |
|--------------------------------|-----------|------------|---------------------------------------------|
| CIP Class ID                   | UINT      | 0x80       | Object class "IO-Link requests"             |
| CIP Instance ID                | UINT      | 0x01       | IO-Link master                              |
| CIP Attributes                 | USINT     | 0x02       | Port number                                 |
| CIP Service Code ID            | USINT     | 0x4B       | Response "ISDU_Read"                        |
| CIP Error Code                 | USINT     | 0x00       | Request processed successfully              |
| CIP Extended Error Code        | USINT     | 0x00       | --                                          |
| CIP User Specific Service Data | USINT     | e.g. 0x12  | Parameter value that has been read (byte 0) |
|                                | USINT     | e.g. 0x34  | Parameter value that has been read (byte 1) |

If an error occurs while the request is executed, the response area has the following content:

| CIP format                     | Data type | MSG Config | Description                                              |
|--------------------------------|-----------|------------|----------------------------------------------------------|
| CIP Class ID                   | UINT      | 0x80       | Object class "IO-Link requests"                          |
| CIP Instance ID                | UINT      | 0x01       | IO-Link master                                           |
| CIP Attributes                 | USINT     | 0x02       | Port number                                              |
| CIP Service code ID            | USINT     | 0x4B       | Response "ISDU_Read"                                     |
| CIP Error code                 | USINT     | 0x1E       | Error code: Embedded service error                       |
| CIP Extended error code        | USINT     | 0x00       | --                                                       |
| CIP User specific service data | USINT     | e.g. 0x80  | IO-Link Error Code: Error in device application          |
|                                | USINT     | e.g. 0x20  | IO-Link Additional Code: Service temporarily unavailable |

**Write\_ISDU**

34385

With Write\_ISDU, the parameters of a connected IO-Link device can be changed.

**Request**

34387

CIP Attribute determines the IO-Link port to which the IO-Link device is connected. The area CIP User Specific Service Data contains the IO-Link index, the IO-Link sub-index of the IO-Link object whose value is to be changed. It is followed, bit by bit, by the value that is to be assigned to the parameter.

| <b>CIP format</b>              | <b>Data type</b> | <b>MSG Config</b> | <b>IO-Link mapping</b>        |
|--------------------------------|------------------|-------------------|-------------------------------|
| CIP Class ID                   | UINT             | 0x80              | IO-Link acyclic access        |
| CIP Instance ID                | UINT             | 0x1               | IO-Link master                |
| CIP Attribute                  | USINT            | 0x01...0x04       | Port number                   |
| CIP Service Code ID            | USINT            | 0x4C              | Request "Write_ISDU"          |
| CIP User Specific Service Data | UINT             | 0x0000...0xFFFF   | IO-Link ISDU object index     |
|                                | USINT            | 0x00...0xFF       | IO-Link ISDU object sub-index |
|                                | USINT            | 0x00...0xFF       | IO-Link ISDU data (byte 0)    |
|                                | USINT            | 0x00...0xFF       | IO-Link ISDU data (byte 1)    |

**Response**

34384

- Positive response**

If the service has been executed successfully (CIP Error Code = 0), the area CIP User Specific Service Data stays empty. The answer has the following format:

| <b>CIP format</b>       | <b>Data type</b> | <b>MSG Config</b> | <b>IO-Link mapping</b> |
|-------------------------|------------------|-------------------|------------------------|
| CIP Class ID            | UINT             | 0x80              | IO-Link acyclic access |
| CIP Instance ID         | UINT             | 0x01              | IO-Link master         |
| CIP Attribute           | USINT            | 0x01...0x04       | Port number            |
| CIP Service Code ID     | USINT            | 0x4C              | Response "Write_ISDU"  |
| CIP Error Code          | USINT            | 0x00              | --                     |
| CIP Extended Error Code | USINT            | 0x00              | --                     |

- Negative response**

If an error occurs while executing the service (CIP Error Code  $\neq 0$ ), an extended error code is transmitted. If the CIP Error Code = 0x1E, then the CIP Extended Error Code = 0x00 and the CIP User Specific Service Data area contains the IO-Link Error Code as well as IO-Link Additional Code. The answer has the following format:

| CIP format                     | Data type | MSG Config  | IO-Link mapping                                                                                                      |
|--------------------------------|-----------|-------------|----------------------------------------------------------------------------------------------------------------------|
| CIP Class ID                   | UINT      | 0x80        | IO-Link acyclic access                                                                                               |
| CIP Instance ID                | UINT      | 0x01        | IO-Link master                                                                                                       |
| CIP Attributes                 | USINT     | 0x01...0x04 | Port number                                                                                                          |
| CIP Service Code ID            | USINT     | 0x4C        | Response "Write_ISDU"                                                                                                |
| CIP Error Code                 | USINT     | $\neq 0x00$ | Error code. see table below                                                                                          |
| CIP Extended Error Code        | USINT     | 0x00        | Extended error code                                                                                                  |

By using Write Failsafe Pattern the fail-safe value of a IO-Link port can be written.

## Request

CIP Attribute determines the IO-Link port. The area CIP User Specific Service Data includes the fail-safe mode and the fail-safe value (Failsafe Pattern).

| CIP Format                     | Data type | MSG Config                                                                                                         | Description                      |

## Response

- Positive response

If the service was executed successfully (CIP Error Code = 0), the area "User Specific Data" will remain empty. The response has the following format:

| CIP Format              | Data type | MSG Config  | Description                       |
|-------------------------|-----------|-------------|-----------------------------------|
| CIP Class ID            | UINT      | 0x80        | IO-Link acyclic access            |
| CIP Instance ID         | UINT      | 0x01        | IO-Link master                    |
| CIP Attribute           | USINT     | 0x01...0x04 | Port number                       |
| CIP Service Code ID     | USINT     | 0x4D        | Response "Write Failsafe Pattern" |
| CIP Error Code          | USINT     | 0x00        | --                                |
| CIP Extended Error Code | USINT     | 0x00        | --                                |

- **Negative response**

If an error occurs while executing the service (CIP Error Code  $<> 0$ ), an extended error code is transmitted (CIP Extended Error Code). The answer has the following format:

| CIP-Format              | Data type | MSG Config  | Description                       |
|-------------------------|-----------|-------------|-----------------------------------|
| CIP Class ID            | UINT      | 0x80        | IO-Link acyclic access            |
| CIP Instance ID         | UINT      | 0x01        | IO-Link master                    |
| CIP Attribute           | USINT     | 0x01...0x04 | Port number                       |
| CIP Service Code ID     | USINT     | 0x4D        | Response "Write Failsafe Pattern" |
| CIP Error Code          | USINT     | $<> 0x00$   | Error code: see below             |
| CIP Extended Error Code | USINT     | $<> 0x00$   | Extended error code               |

CIP Error Code:

| Code | Description                                                                                                                                                                                                                       |
|------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 0x02 | Resource not available: The IO-Link port is busy processing another acyclic service.                                                                                                                                              |
| 0x05 | Invalid class ID or instance ID                                                                                                                                                                                                   |
| 0x08 | Wrong service ID: only service 0x4B, 0x4C or 0x4D is permitted                                                                                                                                                                    |
| 0x09 | Wrong attribute ID: wrong port number                                                                                                                                                                                             |
| 0x20 | Invalid parameter value (e.g. invalid length)                                                                                                                                                                                     |
| 0x1E | Embedded service, error: Error occurred during an IO-Link service. Byte 0 and byte 1 of the User Specific Service Data contain the IO-Link error code and an additional code that are returned by the IO-Link master (see below). |
| 0x0F | Insufficient access rights                                                                                                                                                                                                        |

**Task:** Write fail-safe mode for IO-Link port X02 to "Fail-safe with pattern" and fail-safe value to 0x1234

- IO-Link device in the port: 0x02
- Fail-safe mode: 0x03
- Fail-safe value: 0x1234

From this, the following results for the configuration of the EtherNet/IP command message (MSG):

| CIP Format                     | Data type | MSG Config | Description                      |
|--------------------------------|-----------|------------|----------------------------------|
| CIP Class ID                   | UINT      | 0x80       | IO-Link acyclic access           |
| CIP Instance ID                | UINT      | 0x01       | IO-Link master                   |
| CIP Attribute                  | USINT     | 0x02       | Port number                      |
| CIP Service Code ID            | USINT     | 0x4D       | Request "Write Failsafe Pattern" |
| CIP User Specific Service Data | USINT     | 0x03       | "Fail-safe with Pattern" mode    |
|                                | USINT     | 0x12       | Failsafe Pattern (MSB)           |
|                                | USINT     | 0x34       | Failsafe Pattern (LSB)           |

After successful execution of the request, the response area has the following content:

| CIP-Format             | Data type | MSG Config | Description                       |
|------------------------|-----------|------------|-----------------------------------|
| CIP Class ID           | UINT      | 0x80       | IO-Link acyclic access            |
| CIP Instance ID        | UINT      | 0x01       | IO-Link master                    |
| CIP Attribute          | USINT     | 0x02       | Port number                       |
| CIP Service Code ID    | USINT     | 0x4D       | Response "Write Failsafe Pattern" |
| CIP Error Code         | USINT     | 0x00       | Request processed successfully    |
| CIP Exended Error Code | USINT     | 0x00       | --                                |

If an error occurs while the request is executed, the response area will have the following content:

| CIP-Format             | Data type | MSG Config | Description                            |
|------------------------|-----------|------------|----------------------------------------|
| CIP Class ID           | UINT      | 0x80       | IO-Link acyclic access                 |

## Ethernet Link Object (object class: 0xF6)

34354

The Ethernet Link Object contains status information of the Ethernet interface.

### Class attributes

34312

| Attr ID | Access | Name                | Data type | Description                            | Value |
|---------|--------|---------------------|-----------|----------------------------------------|-------|
| 1       | Get    | Revision            | UINT      | Revision of the object                 | 4     |
| 2       | Get    | Max Instance        | UINT      | Max. number of instances of the object | 2     |
| 3       | Get    | Number of Instances | UINT      | Number of instances of the object      | 2     |

## Profile: parameter

34215

The profile is used to mark the elements of type data as parameters (acyclic data). The profile defines no substructure.

## Profile: processdata

34225

The profile is used to mark the elements of type data as process data (cyclic data). The profile does not define a substructure.

## Profile: runcontrol

61190

### 14.3.2 Overview: IoT types

The ifm IoT Core uses the following element types:

| Name      | Description                                                                 |
|-----------|-----------------------------------------------------------------------------|
| structure | Element is a structure element (like a folder in a file system)             |
| service   | Element is a service that can be addressed from the network                 |
| event     | Element is an event that can be started by the firmware and sends messages. |
| data      | Element is a data point                                                     |
| device    | Root element a device represents                                            |

| Service: getsubscriberlist.....              | 161 |
| Service: getsubscriptioninfo.....            | 162 |
| Service: gettree .....                       | 163 |
| Service: install .....                       | 164 |
| Service: iolreadacyclic.....                 | 164 |
| Service: iolwriteacyclic.....                | 164 |
| Service: querytree .....                     | 165 |
| Service: reboot .....                        | 165 |
| Service: Reset .....                         | 165 |
| Service: setblock .....                      | 166 |
| Service: setdata.....                        | 167 |
| Service: signal .....                        | 167 |
| Service: start.....                          | 168 |
| Service: start_stream_set.....               | 168 |
| Service: stop .....                          | 168 |
| Service: stream_set.....                     | 169 |
| Service: subscribe .....                     | 169 |
| Service: unsubscribe .....                   | 171 |
| Service: validation_useconnecteddevice ..... | 171 |

34056

#### Service: factoryreset

34184

**Name:** factoryreset

**Description:** The service sets the parameters of the device to the factory settings.

**Request data (field "data"):** none

**Response data (field "data"):** none

Example:

```
{
 "code": "request",
 "cid": 4711,
 "adr": "/firmware/factoryreset"
}
```

52345

**Service: getblobdata****Name:** getblobdata**Description:** The service reads a binary large object (blob).**Applicable to:** datastorage**Request data (field "data"):**

| Data field | Required field | Data type | Default | Description                          |
|------------|----------------|-----------|---------|--------------------------------------|
| pos        | mandatory      | number    | 0       | Byte position                        |
| length     | mandatory      | number    | -       | Size of the object (number of bytes) |

**Return data (field "data"):**

| Data field | Required field | Data type  | Default | Description                             |
|------------|----------------|------------|---------|-----------------------------------------|
| data       | mandatory      | STRING     | 0       | Data to be decoded (BASE64 coded)       |
| crc        | optional       | HEX STRING |         | CRC of the data after decoding          |
| md5        | optional       | HEX STRING |         | MD5 checksum of the data after decoding |

**Service: getdata**

34183

**Name:** getdata**Description:** Service reads the value of a data point and provides it.**Request data (field "data"):** none**Return data (field "data"):**

| Data field | Required field | Data type | Description                     |
|------------|----------------|-----------|---------------------------------|
| value      | mandatory      | STRING    | Value of the element/data point |

Example:

```
{
 "code": "request",
 "cid": 4711,
 "adr": "devicetag/applicationtag/getdata"
}
```

## Service: getdatamulti

**Name:** getdatamulti

**Description:** The service sequentially reads the values of several data points and provides them. The value and the diagnostic code are provided for each data point.

**Request data (field "data"):**

| Data field | Required field | Data type        | Description                                                                                                                 |
|------------|----------------|------------------|-----------------------------------------------------------------------------------------------------------------------------|
| datatosend | mandatory      | ARRAY OF STRINGS | List of data points to be requested; data points must support the service getdata ("datatosend":["url1","url2",...,"urlx"]) |

**Response data (field "data"):** for each requested data point

| Data field | Required field | Data type | Description                    |
|------------|----------------|-----------|--------------------------------|
| url        | mandatory      | STRING    | Data point request             |
| code       | mandatory      | INT       | Diagnostic code of the request |
| data       | mandatory      | STRING    | Value of the data point        |

## Service: getelementinfo

**Name:** getelementinfo

**Description:** The service reads the properties of an element of the IoT tree.

**Applicable to:** Objects of the type device

**Request data (field "data"):**

| Data field | Required field | Data type | Default | Description                                        |
|------------|----------------|-----------|---------|----------------------------------------------------|
| adr        | mandatory      | STRING    |         | URL of the element, which properties to be changed |

**Return data (field "data"):**

| Data field | Required field | Data type   | Default | Description                               |
|------------|----------------|-------------|---------|-------------------------------------------|
| identifier | mandatory      | STRING      |         | Identifier of the element                 |
| type       | mandatory      | STRING      |         | Type of the element                       |
| format     | optional       | JSON object | blank   | Format of the data or the service content |
| uid        | optional       | STRING      | blank   |                                           |
| profiles   | optional       | JSON array  | blank   |                                           |
| hash       | optional       | STRING      | --      |                                           |

## Servicet: getidentity

**Name:** getidentity

**Description:** The service reads the device information of the AL1320 and issues it.

**Request data ("data" field):** none

**Return data ("data" field):**

| Data field                | Required field | Data type        | Description                                                                                                                                                                                                                                                                                                                              |
|---------------------------|----------------|------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| iot                       |                | Device           | Device description as JSON object                                                                                                                                                                                                                                                                                                        |
| iot.name                  | mandatory      | STRING           |                                                                                                                                                                                                                                                                                                                                          |

## Service: getsubscriberlist

**Name:** getsubscriberlist

**Description:** The service provides a list of all active subscriptions.

**Request data ("data" field):** none

**Return data ("data" field):** Array with the following data

| Data field  | Mandatory field | Data type        | Description                                                   |
|-------------|-----------------|------------------|---------------------------------------------------------------|
| adr         | mandatory       | STRING           | Data source                                                   |
| datatosend  | mandatory       | ARRAY OF STRINGS | List with URLs of the subscribed data points                  |
| cid         | mandatory       | NUMBER           | ID of the subscription                                        |
| callbackurl | mandatory       | STRING           | Address to which IoT Core event notifications are to be sent; |
| duration    | mandatory       | STRING           | Storage duration of the value                                 |

Example:

- **Request object:**

```
{
 "code": "request",
 "cid": 4711,
 "adr": "/getsubscriberlist"
}
```

- **Return object:**

```
{
 "cid": 4711,
 "data": [
 {
 "adr": "/timer[1]/counter/datachanged/subscribe",
 "datatosend": ["/iolinkmaster/port[2]/iolinkdevice/pdin"],
 "cid": 1,
 "callbackurl": "http://192.168.0.45:80/temp",
 "duration": "lifetime"
 },
 {
 "adr": "/timer[1]/counter/datachanged/subscribe",
 "datatosend": ["/processdatamaster/temperature", "/processdatamaster/voltage"],
 "cid": 2,
 "callbackurl": "http://192.168.0.44:80/temp",
 "duration": "lifetime"
 }
],
 "code": 200
}
```

## Service: getsubscriptioninfo

**Name:** getsubscriptioninfo

**Description:** The service provides information about an existing subscription (subscribe).

The following parameters of the existing subscription are to be used for the query:

- Value of the identifier cid (e.g. 4711)
- Number of the timer (e.g. timer[1])
- Name of the callback topic (e.g. B. temp)

### Request data ("data" field):

| Data field | Mandatory field | Data type | Description                                                                                            |
|------------|-----------------|-----------|--------------------------------------------------------------------------------------------------------|
| callback   | mandatory       | STRING    | Address to which IoT Core event notifications are to be sent; complete URL: http://ipaddress:port/path |

### Return data ("data" field):

| Data field   | Mandatory field | Data type        | Description                                                                                            |
|--------------|-----------------|------------------|--------------------------------------------------------------------------------------------------------|
| subscription | mandatory       | BOOL             | Status of the transferred subscription parameter                                                       |
| datatosend   | mandatory       | ARRAY OF STRINGS | List with subscribed data points                                                                       |
| cid          | mandatory       | NUMBER           | ID of the subscribe request                                                                            |
| callbackurl  | mandatory       | STRING           | Address to which IoT Core event notifications are to be sent; complete URL: http://ipaddress:port/path |

Example:

• **Request object:**

```
{
 "code": "request",
 "cid": 4711,
 "adr": "/timer[1]/counter/datachanged/getsubscriptioninfo",
 "data": {
 "callback": "http://192.168.0.44:80/temp"
 }
}
```

• **Return object:**

```
{
 "cid": 4711,
 "data": {
 "subscription": true,
 "datatosend": [
 "/iolinkmaster/port[2]/iolinkdevice/productname",
 "/iolinkmaster/port[2]/iolinkdevice/pdin",
 "/processdatamaster/temperature"],
 "callbackurl": "http://192.168.0.44:80/temp",
 "duration": "lifetime"
 },
 "code": 200
}
```

## Service: gettree

### Name: gettree

**Description:** The service reads the device description of the IO-Link master and outputs it as a JSON object. The output can be limited to a subtree of the device description.

#### Request data ("data" field):

| Data field | Mandatory field | Data type | Description                                                                                                                                                                                                                                                                                                                                                                                                       |
|------------|-----------------|-----------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| adr        | optional        | STRING    | Root element of the subtree                                                                                                                                                                                                                                                                                                                                                                                       |
| level      | optional        | STRING    | max. level up to which the subtree is output <ul style="list-style-type: none"> <li>▪ no entry: all levels will be displayed</li> <li>▪ 0: do not display sub-elements ("subs")</li> <li>▪ 1: display sub-elements</li> <li>▪ 2: display sub-elements up to the 2nd level</li> <li>▪ 3: display sub-elements up to the 3rd level</li> <li>...</li> <li>▪ 20: display sub-elements up to the 20th level</li> </ul> |

#### Return data ("data" field):

| Data field | Mandatory field | Data type   | Description                    |
|------------|-----------------|-------------|--------------------------------|
| identifier | mandatory       | STRING      | Identifier of the root element |
| type       | mandatory       | STRING      | Type of the element            |
| format     | optional        | JSON Object | Format of the data content     |
| uid        | optional        | STRING      |                                |
| profiles   | optional        | JSON-Array  |                                |
| subs       | mandatory       | JSON-Array  | Sub-elements                   |
| hash       | optional        | STRING      |                                |

#### Examples:

- output the complete device description
 

```
{
 "code": "request",
 "cid": 4,
 "adr": "/gettree"
}
```
- output the subtree counter[2] of the device description up to the 2nd level
 

```
{
 "code": "request",
 "cid": 4,
 "adr": "/gettree",
 "data": {
 "adr": "counter[2]",
 "level": 2
 }
}
```

**Service: install**

52343

**Name:** install**Description:** The service installs the firmware stored in the container area of the device.**Applicable to:** container**Request data (data):** none**Return data (data):** none**Service: iolreadacyclic**

34178

**Name:** iolreadacyclic**Description:** The service acyclically reads the parameter value of an IO-Link device. The parameter is accessed via IO-Link index and subindex.**Request data (field "data"):**

| Data field | Required field | Data type | Description                       |
|------------|----------------|-----------|-----------------------------------|
| index      | mandatory      | NUMBER    | IO-Link index of the parameter    |
| subindex   | mandatory      | NUMBER    | IO-Link subindex of the parameter |

**Response data (field "data"):**

| Data field | Required field | Data type | Description                                         |
|------------|----------------|-----------|-----------------------------------------------------|
| value      | mandatory      | STRING    | Value of the parameter; Value in hexadecimal format |

**Service: iolwriteacyclic**

34177

**Name:** iolwriteacyclic**Description:** The service acyclically writes the parameter value of an IO-Link device. The parameter is accessed via IO-Link index and subindex.**Request data (field "data"):**

| Data field | Required field | Data type | Description                                             |
|------------|----------------|-----------|---------------------------------------------------------|
| index      | mandatory      | NUMBER    | IO-Link index of the parameter                          |
| subindex   | mandatory      | NUMBER    | IO-Link subindex of the parameter                       |
| value      | mandatory      | STRING    | New value of the parameter; Value in hexadecimal format |

**Response data (field "data"):** none

## Service: querytree

**Name:** querytree

**Description:** The service searches a device tree for the criteria profile, type and name and outputs a list with the URLs of the elements found. At least one of the search criteria must be specified. The service can only be executed on the root node of the machine.

**Return data ("data" field):**

| Data field | Mandatory field | Data type | Description                     |
|------------|-----------------|-----------|---------------------------------|
| profile    | optional        | STRING    | Profile of the searched element |
| type       | optional        | STRING    | Type of the searched element    |
| name       | optional        | STRING    | Type of the searched element    |

**Return ("data" field):**

| Data field | Mandatory field | Data type | Description                                                         |
|------------|-----------------|-----------|---------------------------------------------------------------------|
| urlList    | mandatory       | Array     | Array with URLs of the found elements; URLs are separated by commas |

## Service: reboot

**Name:** reboot

**Description:** The service reboots the device.

**Request data (field "data"):** none

**Return data (field "data"):** none

**Example:**

```
{
 "code": "request",
 "cid": 4,
 "adr": "firmware/reboot"
}
```

## Service: Reset

**Name:** Reset

**Description:** The service resets a connection to the initialisation state.

**Request data ("data" field):** none

**Return data ("data" field):** none

**Example:**

```
{
 "code": "request",
 "cid": 4711,
 "adr": "/connections/mqttConnection/MQTTSetup/mqttCmdChannel/status/reset"
}
```

## Service: setblock

**Name:** setblock

**Description:** The service simultaneously sets the values of several data points of a structure.

**Request data (field "data"):**

| Data field | Required field | Data type        | Description                                                                            |
|------------|----------------|------------------|----------------------------------------------------------------------------------------|
| datatoset  | mandatory      | ARRAY OF OBJECTS | List of data points and their new values; data points must support the service setdata |
| consistent | optional       | BOOL             |                                                                                        |

**Response data (field "data"):** none

Example:

Request:

```
{
 "code": "request",
 "cid": 4711,
 "adr": "iotsetup/network/setblock",
 "data": {
 "datatoset": {
 "ipaddress": "192.168.0.6",
 "subnetmask": "255.255.255.0",
 "ipdefaultgateway": "192.168.0.250",
 "dhcp": 0
 }
 }
}
```

Response:

```
{
 "cid": 4711,
 "code": 233
}
```

**Service: setdata****Name:** setdata**Description:** The service sets the value of the data point.**Request data ("data" field):**

| Data field | Mandatory field | Data type | Description                                                                                                                                                                                                                                       |
|------------|-----------------|-----------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| newvalue   | mandatory       | STRING    | New value of the element/data point                                                                                                                                                                                                               |
| duration   | mandatory       | STRING    | Duration of value storage <ul style="list-style-type: none"> <li>▪ lifetime: Value is saved with IoT Core; Value remains valid even after restart of the device</li> <li>▪ uptime: Value is saved until the next restart of the device</li> </ul> |

**Return data ("data" field):** none

Example:

```
{"code": "request",
"cid":4711,
"adr": "devicetag/applicationtag/setdata",
"data":{
"newvalue": "ifm IO-Link master
"duration": "lifetime"
}
}
```

**Service: signal****Name:** signal**Description:** The service starts the flashing of the status LEDs of the AL1320.**Request data (field "data"):** none**Return data (field "data"):** none

Example:

```
{
"code": "request",
"cid":4711,
"adr": "firmware/signal"
}
```

**Service: start**

61196

**Name:** start**Description:** The service starts a connection.**Request data ("data" field):** none**Return data ("data" field):** none

Example:

```
{
 "code": "request",
 "cid": 4711,
 "adr": "/connections/mqttConnection/MQTTSetup/mqttCmdChannel/status/start"
}
```

**Service: start\_stream\_set**

52342

**Name:** start\_stream\_set**Description:** The service starts the sequential transfer of multiple data segments.**Applicable to:** Objects of type data**Request data (data):**

| Data field | Required field | Data type | Default | Description                                            |
|------------|----------------|-----------|---------|--------------------------------------------------------|
| size       | mandatory      | STRING    |         | Total size of data to be transferred (number of bytes) |

**Return data (data):** none**Service: stop**

61197

**Name:** stop**Description:** The service stops a connection.**Request data ("data" field):** none**Return data ("data" field):** none

Example:

```
{
 "code": "request",
 "cid": 4711,
 "adr": "/connections/mqttConnection/MQTTSetup/mqttCmdChannel/status/stop"
}
```

52341

**Service: stream\_set****Name:** stream\_set**Description:** The service transfers a data segment.**Applicable to:** Objects of type data**Request data (data):**

| Data field | Required field | Data type    | Default | Description                           |
|------------|----------------|--------------|---------|---------------------------------------|
| value      | mandatory      | BIN (BASE64) | *       | Segment of binary data (BASE64 coded) |

**Return data (data):** none**Service: subscribe**

61198

**Name:** subscribe**Description:** The service subscribes to the values of data points. The data points to be subscribed are transferred as a list. The IoT Core sends changes to the data sink defined in callback.

CSV formatted notifications can only be transmitted using the TCP protocol via an activated and configured MQTT channel.

**Request data ("data" field):**

| Data field | Mandatory field | Data type        | Description                                                                                                                                                                                                                                                                                                                         |
|------------|-----------------|------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| callback   | mandatory       | STRING           | Address to which IoT Core event notifications are to be sent; URL format:<br><ul style="list-style-type: none"> <li>▪ JSON: http://ipaddress:port/path</li> <li>▪ JSON: ws:///path</li> <li>▪ JSON: mqtt://ipaddress:port/topic</li> <li>▪ CSV: tcp://ipaddress:port/path</li> </ul>                                                |
| datatosend | mandatory       | ARRAY OF STRINGS | List from URLs of data elements; Elements must support getdata                                                                                                                                                                                                                                                                      |
| codec      | optional        | STRING           | Format of the returned data<br><ul style="list-style-type: none"> <li>▪ json: JSON formatted</li> <li>▪ csv: CSV with standard separator (,)</li> <li>▪ csv0: CSV formatted with comma separator (,),</li> <li>▪ csv1: CSV formatted with semicolon separator (;)</li> </ul>                                                        |
| DURATION   | mandatory       | STRING           | Duration of value storage<br><ul style="list-style-type: none"> <li>▪ lifetime: Value is saved with IoT Core; Value remains valid even after restart of the device</li> <li>▪ uptime: Value is saved until the next restart of the device</li> <li>▪ once: send only one notification, user must unsubscribe immediately</li> </ul> |

**Return data ("data" field):** none**Notification:** JSON

```
{
 "code": "event",
 "cid": 4711,
 "adr": "",
 "data": {
```

```
"eventno":"EventNo",
"srcurl":"SrcURL",
"payload": {
"eventurl": {"code":EventStatus,"data":EventData},
"datapointurl_1": {"code":DataStatus_1,"data":DataValue_1},
"datapointurl_2": {"code":DataStatus_2,"data":DataValue_2},
...}}
}
```

**Notification:** CSV

SrcURL,EventNo,EventStatus,EventData,DataStatus\_1,DataValue\_1,DataStatus\_2,DataValue\_2,...

- SrcURL: Source of the event (data point on which subscribe command was listed)
- EventNo: Event number
- EventStatus: Status code of the event
- EventData: Event data
- DataStatus\_1: Status code of the 1st element in list datatosend
- DataValue\_1: Value of the 1st element in list datatosend
- DataStatus\_2: Status code of the 2nd element in list datatosend
- DataValue\_2: Value of the 2nd element in list datatosend
- ...

34197

**Service: unsubscribe****Name:** unsubscribe

**Description:** The service deletes an existing subscription. The service unsubscribe is successful if cid and the callback address are registered for an active subscription (subscribe). If the STRING "DELETE" is provided in callback, the IO-Link master deletes all active subscriptions.

**Request data (field "data"):**

| Data field | Required field | Data type | Description                                                                                            |
|------------|----------------|-----------|--------------------------------------------------------------------------------------------------------|
| callback   | mandatory      | STRING    | Address to which IoT Core event notifications are to be sent; complete URL: http://ipaddress:port/path |

**Response data (field "data"):** none**Service: validation\_useconnecteddevice**

52340

**Name:** validation\_connecteddevice

**Description:** The service checks, whether Device ID and Vendor ID of the connected IO-Link device match with the values of the datapoints ../validation\_vendorid and ../validation\_deviceid.

**Applicable to:** Objects of type stucture**Request data (data):** none**Return data (data):** none
